2188. Maidenhead Locators.

Newsgroup: rec.ham-radio
Date: 1990-04-09 12:30:41 UTC
From: hugh_davies.WGC1RX@XEROX.COM
Message-ID: <900409-053203-5445@Xerox>
Source record: 12239

In INFO-HAMS V90 #371,
zaphod.mps.ohio-state.edu!usc!pollux.usc.edu!kjh@tut.cis.ohio-state.edu
(Kenneth J. Hendrickson), says;

<...Somebody asked about the Maidenhead Grid Square Locater System. Here
are the details of how this system works. This system is in widespread
use in North America on VHF/UHF/SHF/EHF. I believe that it is also
catching on in Europe...>

Har, har, har!!!

Kenneth, it was *invented* in Europe. We have had a European wide locator
system for some years. It was called the "QRA locator" system. It suffered
from a number of shortcomings, in that it couldn't be extended world-wide,
and it was difficult to calculate distances between stations using it. The
Maidenhead system was design to supplant the QRA system, whilst providing
some upwards compatibility - the Maidenhead squares correspond with the old
QRA squares directly.

<...On higher
bands, (or maybe for other reasons), you might want to identify your
location more accurately...>

Like VHF contests using radial-ring scoring.

73,

Hugh Davies, G0CNR.
(IO91US. 71 squares in 16 countries on 144MHz)

>>KB2JLY
>And, be fully prepared to pay MORE for a service which costs the telco LESS to
>supply than it does for them to supply voice lines for the modems. ---

C'mon gang, let's quit discussing the alleged merits of this chain
letter!

The FCC NEVER proposed a modem tax. They did once upon a time, years
ago, discuss a charge scheme that would have classified some services as
equivalent to long distance carriers. Some of those services were modem
based, some voice. The whole plan was killed, then a stake was put
through its heart, then it was cremated and buried under Cthulhu's
crypt.

Southwestern Bell, in an entirely different matter (see alt.cosuard, I
guess), decided that home dial-up BBSs were "business" users and thus
had to pay business line rates; that's being fought. But it too has
nothing to do with the way lines are muxed. BTW, the telco can't split
one voice channel into 6 9600's on a dial-up basis; they don't know
what your modem's doing, and have no right to intercede unless you
ask them to! A dial-up call today is a 3.1 kHz audio path. ISDN's a
different story; a path will be 64 kbps, OR 3.1 kHz audio, depending on
what you ask for.

.
.
.

Can ANYONE help me??? A friend of mine and I own a Microwave Modules transverter... one is the 432 version, the other is the 144 version.

We bought these at a flea market without any manuals or schematics.

I have been able to get a partial copy of the manual for the 432 version, but it does not seem to match the unit that I have exactly. The manual references a single "input level" pot, and a jumper post pair that can be used to adjust for the input drive level of 1 to 500 mw. My unit has TWO (or appears to) potentiometers that seem to affect the output level and there is no jumper post pair to be found on the board.

The 144 version does seem to have a single pot and the jumper post pair that is mentioned in the manual that I have for the 432 unit...

Does anyone have a manual AND SCHEMATICS for these units???

If so, I would be interested in obtaining a copy of each....

Also... if anyone has one of these units for SALE (for any band)... please let me know, as we may be interested in obtaining more units.

Thank you,

Rich (NM1D)

> 300000 - up whatever you can manage

I have a poster on the wall listing ALL the allocations (neat colors too!)
for Canada published by the DOC. It shows the same allocations as you
document here. However, on looking at the TRC (rules) I note that there
are no amateur specifications above 24 GHz. I called a friend at the
local DOC to enquire about the discrepancy and was told that since no-one
had asked, there was no formal allocation. I suspect the wall chart was
drawn to illustrate the ITU allocations for the region. The basic stance
of the local office has been "a request for a formal interpretation means
work for us, and as we are short staffed, you might not get what you
think you deserve". The unspoken meaning is "do it, but if we get any
complaints, we might have to make a ruling".

This was brought home after I asked for a clarification of the rules for
902-928... it seems that since I am NOT an advanced amateur, I can NOT use
CW on this band, A3 and F3 only!!! So far no-one has complained about my
(albeit sloppy) code on this band!

So that little anecdote aside, there is a small group (10 or so) in the
{Hamilton, Toronto, Cambridge, London} Ontario area on 10 GHz FM and I
am working on integrating a 200 mw SSB Electronics transverter into a
rice-box all-mode mobile rig for the contest in August/September.
(Still looking for a SMA to waveguide transition too.)

Also wrt 300000 GHz and up, VE3LPP is interested in HeNe laser operations (best DX is 2Km at the moment). Great for the quick-and-dirty set up on a LOS path for the "lower" bands. (I know, I know... watch the eyes!)

From: disbrow@skipper.dfrf.nasa.gov
Message-ID: <482@skipper.dfrf.nasa.gov>
Source record: 12247

Hi, I'm studying for my novice and I have a question maybe some
of you could answer.

I have a hand-me-down 18-ATV Hy-Gain vertical antenna (10-80 meters)
about 25' long. I'm thinking of mounting it on top of the house
to a vent pipe. There seem to be plenty of vent pipe mouning kits,
but I think they're really designed for a shorter TV antenna.
I'd really like to guy this thing higher than the base but some
of my OF friends say I shouldn't use anything conductive except
on the radials.

I was thinking of using a high test fishing line, but the
people at the fishing stores say this stuff stretches too much
because its monofilament.

I live in a high wind area where 70 knot gusts are not uncommon. I
really don't want that kind of torque on the vent pipe.

So how do you guy those verticals at a point other than the base?
Also, is it OK to use 22 guage wire for the radials?

Thanx,
Jim

Has anyone petitioned NASA to have the first Amateur repeater on Space Station Freedom? I'd love to have my call broadcast for all those extra-terrestrials to hear :-). Seriously, it'd be a great PR thing, and pretty nifty to show school kids, as well as being useful to us Amateur types. You could have all sorts of nifty packet stuff, experimental beacons, ATV, FM voice, etc. Imagine an all-mode radio station a la w1aw floating around up there. I'm sure NASA wouldn't mind an extra EVA or two to put up new antennas or adjust the linears :-) (Hehhhhhhllo.) It could even be attached to the outside of the station via a large mag-mount, so that it could be moved for station expansion or easy repair. Please post or E-mail you comments.

>to do so, but only for the sheer entertainment value of working weak signal
>stuff...not everyone is so easily amused! ;-)

funny thing about proposal # 4 is, given human nature, it probably would
ENHANCE the lifetime of CW as a widely used mode, for exactly the reason
you state...entertainment value. I enjoy CW, was pretty good at it when I
used it regularly, but have to agree it isn't relevant. Besides, boring
conversations about the rig, the signal report, and so on can take place
in any language and using any mode. Only 1/2 :-) here; this I view as one
of the reasons for the decline of the hobby.

I guess it depends on how badly you want to run mobile; I ran HF mobile from a Plymouth Horizon for about 2 years...with an IC-730 which isn't exactly a small radio. I built a wooden stand which sat over the hump in the floorpan and held the radio up at about a 30 degree angle so I could see and reach the controls. I still use the stand, but now in a Voyager. Only problem with HF mobile is that if you have a voice that tends to drive the rig to full PEP frequently, you can see the lights dim slightly on voice peaks :-(. Doesn't seem to really hurt anything, just runs the radio to its limits.

HF mobile, by the way, is great fun! 20m can be frustrating, but 15m DX right now is almost as good, sometimes even better, and 40m daytime ragchewing isn't too bad if you find the right conversation--it always seems to me that 40 in the daytime is populated by a bunch of old f*rts who've known each other for 40 years, and talk in a sequence of 5 minute monologues with about 1 second for you to get in edgewise.

Good luck with whatever setup you end up using!

Hope and pray that the line is not busy. If it is, that "wonderful"
answering machine will tell you using an automated voice. The real
catch is that YOU STILL PAY FOR THE LONG DISTANCE CALL just to find
out you can't talk to anyone.

This is why I currently refuse to consider purchasing any Kenwood product.

Hams report good results using plastic "Weed Eater" (tm) string for supporting wire antennas, including 1750m transmitting antennas which are somewhat like Tesla coils and very sensitive to insulator leakage.

The stuff is very strong, and relatively inexpensive. I don't know about long-term stretch. The colored varieties are probably more resistant to sunlight deterioration.

repies:

What blithering lunacy!! Ham radios don't kill children playing in their
schoolyard!!! If you don't see any difference between guns that kill and
radios that don't, then you yourself are part of the proof that guns MUST
be banned as soon as possible.

I say:

I personally just wanted to say how much I enjoy seeing such a logical and
level headed response from Mr. Grubs. I had in the past believed that he
tended to go off half-cocked and misread what people were trying to say
with the result being a massive flame battle starting on this net over
matters not related in any way to ham radio. In short, that he just liked
to participate in hateful arguments.

It is nice to see that I was so totally wrong in my beliefs and that he
can offer such a thoughtful and calm response to another persons point of
view. I am sure all of you who read the above will agree. So let me say
in public how sorry I am to have felt this way and hopefully when I meet
this gent on the air I can tell him so ..... personally.

p.s. It will be hard to talk though... this tongue keeps pushing my cheek
so hard.... maybe we can have a CW QSO.

Uhhhhh.....The "Absolute Sound"?? Are you SURE? These are the guys who publish stuff about "skin effect" (at audio frequencies!) in speaker cable and other weirdness. Anyone looking for a laugh should check out Enid Lumley's monthly column. Recently this column claimed that folks who want "real" high fidelity should pay attention to the routing of power cords to the stereo system. I swear, I thought they were talking about microwave waveguides....warnings that sharp bends in the power cord could cause audio distortion! This magazine even suggested that the power cord be delicately suspended so that it didn't come in contact with any hard surfaces!
>
> As a side issue, does anyone out there know when Heath started? The
> catalog doesn't say. I expected to find some sort of advertising puffery

I think their first product was an airplane kit (not a model, a REAL airplane that you could build in your garage!) in the early 1950s. After that, I think their first electronic kit was an oscilloscope.

Does anyone remember their first personal computer? When I was a little kid in Berkeley about 30 years ago the father of a friend of mine had one. It was an analog computer, and was constructed on a big sloping console.

Even in a large home, an unmodified cordless phone should work just fine.
Since there are many cordless phones that boast "1500 foot range", I
doubt if you would need a special antenna just for walking around the
house.

I modified one for my office for greater range. Not exactly legal, but
it works.

I bought one of those cute little cordless "LiteSet" units made by
Plantronics, and sold by DAK. I put the base on top of a metal filing
cabinet, and opened up the case....finding a ground connection on the
PC board where I connected a lead going to several ground radials.
I stretched two across the wall that the base unit and the cabinets
are up against, and stetched two more diagonally across the cabinets
and taped the extra length down over the corners. Then I took one more
wire, and attached it to the same place where the base unit antenna
was attached. Because the whip was short, I shorted out some of the
turns on the series inductor, since I was now using a full 1/4 wave
radiator. I took this wire and ran it vertically up the wall, terminating
it on a tack. The radials and the vertical element were each
5 feet long, which is about 1/4 wavelength on the transmit frequency
of the base unit.

This is a real handy device to have around the office. I can even
go for a walk out in the woods, and still take customer calls!

What if they hear enough to identify who you are?

> Perhaps so, but the hams will be within the law, since the wireless
> speakers must accept any inteference. Just politely tell the owner of
> the wireless speakers than he should take a hike.

The ignorant member of the public is not going to notice that you are
polite; he is only going to notice that you are refusing to stop with
the interference (assuming he has identified you).

> Lawsuits of what kind? Civil suits on what grounds? Criminal charges....
> no way....you are within the letter of the law. Anyone foolish enough to
> file a civil suit will lose, and then you can counter sue for false and
> malicious lawsuits.

Unfortunately, you often have to front quite a large sum of money to defend
yourself even in a frivolous lawsuit that you could collect fees and costs
from when you win.

> OK, then don't broadcast to the owner of the speakers, just keep on
> boradcasting your normal stuff......he is still going to experience
> interference that will render his music unenjoyable!

If you know the interference is taking place, you better be prepared to
defend against the guys lawyer citing "INTENTIONAL interference" and saying
that since you knew the interference was taking place, despite the fact
you have a license, you have so many frequencies you could have chosen
a different one, and yet you chose to continue the interference.

(I'm playing devil's advocate here, just be prepared)

>have stayed in the market.

I will heartily second this and venture some comments on the issue. One aspect of the "chicken-and-egg"ness of the situation is that it appears there is absolutely NO "trade press" for the SWL marketplace (and, actually, for the amateur marketplace, too). I get a consumer-electronics dealer publication called "Audio-Video International" -- with a name like that it would be a natural to include a section on shortwave radio and ham gear, even if not in every issue at least quarterly or thereabouts. I've filled out comment cards and the "suggested article" section of their bingo cards for *years* with comments and suggestions that they institute at least some coverage of this marketplace, but they ignore the field.

I know of no dealer-oriented publication anywhere in the consumer electronics field that even acknowledges the existence of the SWL market or even the larger (or at least more-varied-product) ham market. I believe no ham or SWL manufacturer displays their wares at the CES trade shows (except for what portable SW radios might show up in the Sony or Panasonic displays).

With no trade press or "push" from the manufacturers encouraging retailers to get interested in serving this market, few, if any (who are not already interested in the field due to their own personal hobby), will make any effort to address this field. So there are few stores selling these products, and thus little awareness of them in the general public, who learn about goods and services mainly through advertising and no one is buying general-media ads for this stuff because the only dealers are small specialized or mail-order places who wither cannot afford to buy such ads or can't justify the expense on the expected return from such "cold" ads or "informational" ads.

As a side issue, the only periodical outside the electronics-hobbyist press I've even seen any detailed or worthwhile coverage of shortwave

radio in is "American Survival Guide", a survivalist monthly that has articles on ham gear and shortwave in amongst the ones on emergency medicine, food growing and storage, and weaponry. And that serves another limited-scope specialized audience, anyway. What we need is the same degree of coverage in the general media as they give to VCRs and camcorders -- not an awful lot, and not terribly accurate, but at least *something*.

Mentioning Radio Shack and other retailers who *do* attempt to sell SW reminds me of an amusing (or disenheartening :-) incident from about 17 or 18 or so years ago. I was at one of those "catalog outlet" type stores in central Illinois while on vacation -- one of those places that has a sample of everything displayed and you request what you want at an order window and the stuff comes out of the bowels of the warehouse in back or below in a bin on a conveyor. I was looking at some Nordmende SW radios and the guy who was waiting on me turned out to be the store manager. I tuned around on it and made some comments to my wife and the guy realized I knew something about shortwave and started asking questions. I explained a bit about what bands got the best reception at what times of day and the guy offered me a job then and there! I think I was the first person he had encountered who appeared to know anything at all about consumer electronics and SW in particular... :-) What this illustrates is that this is a kind of product that requires knowledge on the part of the salesperson, and that may be next to impossible to find these days -- the stores cannot afford to pay enough to the salespeople to keep anyone knowledgeable enough to sell the stuff; those people will find better jobs easily and quickly, and the markup and volume sold can't provide enough sales commission to support competitive pay. That situation won't change until the general level of technical knowledge in the population rises; since it appears to be headed down, instead, things are not likely to improve... Radio Shack makes some attempt to train its sales force, I suppose, but they have to emphasize the higher-volume and more profitable aspects, and the one or two SW radios they sell get left out. So you're not likely to find an SW-knowledgeable clerk at RS, either.

The last time I delt with Kenwood was to get a replacement
LCD for my TR-2500. As some of you might recall, the display had
a tendency to become unreadable after a few years. I called
Kenwood, told them about my problem (they were aware that the
LCD in the 2500 had this problem). The sent me a new LCD free,
no questions asked.

Subject: Heathkit catalog

The airplane was the first heathkit and the scope was the first electronic kit. However I don't believe the big sloping console analog computer was their first. They also made a much smaller analog computer in a rectangular box that I used in high school. I recall the bigger unit becomming available after our unit was up and working and those who really knew how to use it wanted to upgrade, but the administrators said NO! I used to have one of the first scopes (serial no in the 20s), but the pots were too gummed up and it was too big for my limited needs. Years ago one of their catalogs had a history of the company. It was quite interesting.

Why just those two? Consider a well made and very fine transciever
from Ten-Tec. Two models to chose from in that price range. Service,
if needed, stands heads and shoulders above the rice-box send it in
and we will give you a quote variety. You can actually fix these
radios yourself. How novel.

For my money I would buy the American instead of the Japanese.

Antennas West markets a very fine black dacron line for antennas. The black variety holds up good in the sun light. I think I paid around $20 for 200 ft. It's about 3/16 inch in diameter and has a 700 lb. breaking strength.

Antennas West
Box 50062-c
Provo, UT 84605
(801)-373-8425

The 22 ga would work for ground radials, but it is kinda light. Use somehing more around 18 ga or so. Don't forget that there is current flowing in the radials and the losses go up as the ground system becomes less efficient.

> equipment?
>
> ....

>John Kirby

I have not tried a Visitel on the radio but I have serious doubts
that it could ever work. The details of the transmission format are
a little fuzzy in my brain but here is what I recall.

The image starts with a digital header containing synchronization
signals and information about the image size. After this there is NO
horizontal sync as in most ham SSTV formats.

The picture is composed of 96 x 96 pixels of 32 gray levels.
The pixel rate and audio carrier frequency are both 3579545/2048
per second. Gray levels are conveyed by a combination of phase and
amplitude modulation. 2 phases (180 degrees apart) and 16 amplitudes.
Each pixel is one audio cycle.

This is fine for a phone line or FM radio. Let's perform a thought
experiment about what would happen on SSB ...

Suppose your tuning was off by 20 Hz. The receiving end expects one
pixel per audio cycle and would gather the pixels at 1727 or 1767 per
second while the sender is producing them at 1747 per second.
The phasing would be all messed up. AGC and QSB would also mess up the
amplitude modulation of the audio carrier.

Several people have proposed using the Visitel for HF SSTV but I have
never heard of any success. I would be very interested in hearing
more about people's experiences with it.

If you would like to try SSTV at a low cost use your home computer.

* AEA has an interface for the Amiga for about $300.

* SPEC-COM has SSTV software for the Radio Shack COCO. I think it was about $40.

* A color SSTV program for the Atari ST is available from several user groups. It requires a simple interface that can be built for about $7. See 73, December 89 and January 90.

* I have a vague recollection of a product for the IBM PC from a company named something like Computer Systems Consulting. But it was only black & white. You don't see too many B&W pictures anymore.

In summary,
- The Visitel is not compatible with any of the ham SSTV modes.
- The Visitel modulation scheme can't be decoded by the usual Frequency to Voltage demodulators.
- I seriously doubt the Visitel would work over an SSB radio. (Please, someone - prove that I'm wrong!)

Color SSTV can be very expensive but it doesn't have to be anymore. If you must have 262,144 colors, spend $1295 on a Robot 1200C. If you want to make only a small investment to try something new, use one of the systems based on a home computer.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

SPRING FLEA AT MIT
Sunday, April 15, 1989
9AM-4PM

Come to the city for a great flea - plenty of free parking.

MIT's semi-annual electronics and ham radio
flea will take place on the Sunday of Patriot's
Day weekend again this year.

There is tailgate space for over 200 sellers and
free, off-street parking for 1000 cars!

Buyers admission is $1.50 (you get 50c off if
you're lucky enough to have a copy of our add)
and sellers spaces are $6.00-each at the gate

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 4PM, with sellers set-up
time starting at 7AM. Have no fear of rain, a
covered tailgate area is available (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)

For more info / advanced reservations 617 253 3776

2221. CALL FOR VOTES - rec.arts.tv.cable

Newsgroup: rec.ham-radio
Date: 1990-04-11 03:04:39 UTC
From: mrapple@quack.UUCP
Message-ID: <5266@quack.UUCP>
Source record: 12267
Cross-posted to: news.groups,rec.arts.tv,rec.ham-radio,rec.radio.shortwave,sci.electronics

[followups to news.groups. crossposted to s.e r.h-r for technical reasons,
r.r.s because of satellite discussions]

After the disaster during the first week, voting has proceeded smoothly,
but at a pace which will not result in passage of the new group. The
current count is 19% no, 81% yes, with 36 votes received. If you want
this group to succeed, please vote for it, if you haven't already. I
believe this group will be a useful one, but 99 other people have
to agree. Please check the votes list. If your name is not there and
you have voted, please vote again. I will filter the dupes.

I've been told that many have sent mail to quack.uop.edu. quack is NOT
in the .uop.edu domain. Either use uop.edu!quack!... or ...%quack@uop.edu
or some such.

CHARTER: REC.ARTS.TV.CABLE

This group is for discussions pertaining in general to cable television,
and satellite television. Broadcast only issues should go to rec.arts.tv.
More specifically, discussions of technical, regulatory, programming,
and/or customer service/cost/quality issues are welcome.

Technical discussions of cable programming technology are welcome, which
is somewhat at odds to its placement in "rec," but this is proposed
simply because of the infeasability of placing the group elsewhere.
The original name rec.arts.tv.catv was objected to by several
because of the confusion over the designation "catv" meaning
community access TV instead of community antenna TV. Several have
objected to placing the group in rec.arts, but there have been no
alternative suggestions.

The newsgroups line would read:

rec.arts.tv.cable Discussion about cable and satellite television

This newsgroup would not be moderated. It distribution would be
world-wide.

To vote, send mail to:

uop.edu!quack!vote-no for no votes
uop.edu!quack!vote-yes for yes votes

A daemon will pick out the "From:" line and add it to a file. No reply
will be sent. Second call with vote list will be posted Tuesday the
3rd, and third call with vote list will be posted Tuesday the 10th.

The vote will end April 16, 2359 UTC, with the usual 5 day wait for
late mail.

Any personal mail may be sent to ...quack!mrapple, but votes sent there
will not be counted. Posted votes will not be counted.

Vote list as of 4/10/90, 0000 UTC:

No, California judicial systems that don't lock up criminals with a
history of violence are what killed those children in Stockton. If
Patrick Purdy had been left in jail the previous 6 times, they would
be alive now. (His own mother had him arrested once, and he has
assaulted police officers before as well)

Just when I thought it was safe for Jim to come out of the
kill file! You missed the point on the orig posting, (As usual!)
and are picking a poor "case" to discuss "blithering lunacy" about!

Hello, I've been following the radio modification thread for some time
but haven't seen any for my new radio.
So, if anyone knows how to modify the Yaesu FT-811 for extended tx/rx
please send e-mail or post a message.
I was a at a Ham Swap recently and someone was selling a modified FT-811
for some ridiculous price. Of course I asked him how to do it, he refused to
tell me, but offered to modify my radio for a fee! I wonder if he was a ham.
So anyway it looks like it is possible, I just need to know how.
Thank you for your time...

THis shouldn't be too hard to get. In almost every episode where they
are in the garage gives a glimpse of the call sign. It is on a nameplate
(call plate) like you can get at any hamfest or engravers on top the
radio. The ham operator in the show is supposedly mr Tanner.

2227. No Code - My two cents worth

Newsgroup: rec.ham-radio
Date: 1990-04-11 13:30:13 UTC
From: ean@gvlv3.gvl.unisys.com
Message-ID: <631@gvlv2.GVL.Unisys.COM>
Source record: 12279
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Herewith follows my opinion on the so-called "NO CODE LICENSE"

In the beginning there was spark gap and CW, or to be more correct interrupted continuous wave (ICW). Therefore there was a need to test would-be amateur radio operators in rules, regulations, *AND* operating proficiency in ICW.

This is 1990. We have not only ICW available, but also AM, FM, SSB, NBFM, RTTY, PACKET, MCW, etc., etc.

Therefore, I propose that the amateur bands be broken up into exclusive segments for each mode of operation. No longer will CW be allowed anywhere in a band.

I also propose, that the would-be amateur radio operator be required to take a test for *HIS* mode of operation in addition to the required test in rules and regulations.

Call signs would be issued based on the mode of operation in order to police the bands. i.e. PA3xxxx for Packet License in the 3rd call area. CW3xxxx for CW License in the 3rd call area. etc. The prefix would designate the mode of operation. Naturally to avoid confusion with calls of other countries a complete world-wide re-issuance of call signs would be needed.

I think this would appease those who claim "my call is like my name, I don't want to change it." (shades of incentive licensing). But, just think, if you operate three different modes, you'll have three different calls.....just like a - first name - middle name - and last name.

Note to possible ARRL officials:

Please consider the above when next attending a League policy meeting. Thank you.

In Message-ID: <35125@genrad.UUCP> Diana Syriac asks how common it is to be able to send code with either hand......

I am a mixed-mode operator (phone,CW,digital) but I particularly enjoy CW and always have. I know many CW operators and have encountered *very* few who can send with either hand. Most of the CW ops I know can send with only one hand and generally write with the same hand. This is particularly distracting when handling NTS traffic or operating a CW contest because one has to drop the pencil each time he needs to make an entry in the log. (Well, if you're using a computer contest logging program that sends CW for you this isn't true!) I send with my right hand and write left-handed, which is a real blessing.....

Reference increasing code speed...

These are some general comments and/or observations after passing the test myself and working with about a dozen others at various speeds. Before you read this, review the meaning of the abbreviation "IMHO."

IMHO:

* PUSH A LITTLE. Listen to faster than you can copy and "push the envelope". I like to have my 20wpm folks listen to W1AW or whatever source at higher for a while and then slow to the target speed. W1AW sends at 35,30,25,20 (,15,10...) So we listen through 20 and quit. I tell 'em not to worry if they can't write it all down at 35 and 30 (I can't!) but LISTEN to aid concentration and quicken recognition. MOST of the observe they can hear "the", "and", "of" and other short, common words.

If you're using a computer, set the speed up to 25 for about five minutes. You'll do really rotten. Then slow down to no less than 20. It really sounds slower.

If you are still at 13 or so, trying to build toward 20, I recommend that you USE THE FARNSWORTH METHOD! It really does make a difference.

* BE REGULAR. Spend some time EVERY DAY. Even if just a little bit. It's tough between work, school, family, other activities, but it only needs last until you pass that test! (Unless you really get hooked on CW!) An hour a day is terriffic! Half an hour per day is good. Even only TEN MINUTES PER DAY EVERY DAY is better than ONE HOUR ONCE A WEEK. Sometimes it helps if you have someone else to work with, because the other person helps keep you on schedule, encourages you when you do well, rags on you when you slack off.

* CONCENTRATE. Keep up the pacing. I HAVE DIFFICULTY WITH THIS MYSELF. When you miss a character (or word) FORGET ABOUT IT. Don't spend time flustering over it while other characters (or words!) are still being sent. Leave a space or draw an underline or SOMETHING, but keep your concentration ON. Keep up with the speed. Some folks can hear the code but can't write fast enough.

If you have time afterward, maybe you can figure out what it was.

* SEND. The rules, or the popular interpretation of the rules, do not require you to send. I don't know of a VEC that tests sending, and the rules say you can't flunk for bad sending.

When you send, you are translating the code from the abstract letter symbol to a definite action. (You press the key for a short while, wait a short while and press the key for a three short whiles and wait three short whiles. That's an "A".)

If you're working by yourself, you don't really NEED an oscillator. You can tap on a table, steering wheel, your knee, etc. What you are learning to associate with the letter symbol is the muscle contraction (wrist motion). That's fairly personal. You can touch your nose because you "know" where it is. You learn an "A" because you "know" the pattern.

(most important!) DON'T GIVE UP! Some folks take longer than others. Some folks have more time to devote to it. Some folks are more committed (some say I *should* be! :-)) I really believe the part in the movie "Stand and Deliver" where the teacher talks about "ganess" (howzat spelled?) the *desire* to do what it takes. Self confidence makes a big difference. It's not "DON'T GIVE UP ON THE CODE," but "DON'T GIVE UP ON YOURSELF!"

TRUTH TIME:

OK, I admit it. When my 1-year, non-renewable Novice ticket was about to expire, I was *not* ready to pass the 13 wpm test. So I was a Technician for a few years. I FLUNKED THE 13 WPM TEST SEVEN -COUNT'EM- SEVEN TIMES AT THE FCC FIELD ENGINEER'S OFFICE IN PITTSBURGH. The EIGHTH time was a charm. A buddy and I worked together, harassing each other into not slacking off and encouraging other (maybe a little competetive?) and we both passed that day.

I kinda laid off the code for a while, and was even "out of" ham radio for a while (2m FM only) and on the 20th anniversary of my first Novice QSO I got sentimental and started messing around with code again. I was amazed how fast I was able to reinforce the code. Also, the new VE exams were, it seemed, easier. I sat down at the exam at a hamfest and thought, "Oh, what the heck! If I flunk it now, I can go take it again in three weeks at the session in Dallas!" NO PRESSURE. NO 30-DAY WAIT. NO INTIMIDATING FCC OFFICE. Whaddya know! I passed!

As a final, general observation, I would hazard the opinion that our worst obstacle is ourselves.

Good luck,

Bob West WA8YCD
Texins Amateur Radio Club

Can't predict local interference results, but would recommend you try a
High-Q "Army-loop" type, or more specifically, the "Ted Hart" version of
the Army-loop....described in the latest ARRL Antenna Book (15th ed).
Ted Hart wrote that section. Instead of using large copper tubing as
they suggest, use low-cost aluminum lawn-edging...available in hardware
stores. It is about 4" wide and comes in rolls of 20' and 40'. You can
flatten out the corrugations. I have used this quick, easy, lo-cost
scheme in the attic of my garage on 20, 40, 80, and of course it can
be used on any of the bands except 160 which would be too large to be
practical indoors. (also a wider width 7"? is also available). A neat
trick is to overlap the ends at the top of the vertical loop and sandwich
stryrofoam dielectric in between to form the tuning capacitance. This
avoids losses by otherwise making connections to a tuning capacitor...
which is very important because the high-Q circulating currents may
approach 100 amps?. It must be high-Q (and of course narrow-band) to
perform properly. It is very easy to feed...just attach the shield of the
50-ohm feed coax to the bottom-center, and the center of the coax simply
extends 2' to 4' to experimentally get a perfect 1:1 SWR. It usually is
better to put some capacitance in series with this wire. It can be con-
sidered a "Gamma-match". Small alligator-clips can be used to clip on
to the aluminum. I used a double-layer 20' perimeter on 20 meters (dou-
bled a 40' roll). This provided extra layers at the open-top end to
sandwich in more sections of capacitance-overlap as required.
I have not gone back to try this scheme on 40 meters but may go back and
try it there...perhaps using the 7" width (I previously attached extra
metal sheets to get enough capacitance for 80 meters). I suggest that
if you use a double-layer for the 40' perimeter, you can separate the ends
at the top, fold them back in the form of a double "J"....do the same
on the other end, and when you mesh them together at the top, you will
be able to insert 5 pieces of styrofoam dielectric which should provide
sufficient capacitance without arcing across...certainly on 40 meters and
even possibly on 80 meters. You would however, probably be limited to
100 watts to avoid arc-over.
My 40/80 meter loop is 40' perimeter (7' high and 13' wide rectangle)
in the attic of my garage which even has aluminum siding on it. The
bottom of the loop lays directly on the wood attic floor...everything
else supported by nylon cords. I have tested this scheme quite a bit and
get very good results. I have also used 1000 watts sometimes, but
arc-over can be quite a problem if the spacing is too close. If you try
this and have good results, please report back to me, or to this net
because I feel a lot of people in limited circumstances (space or finance)
could benefit. Many people are not inclined to believe that it can work
so well (Read the ARRL ref. mentioned above for some encouragement).
By the way, if you have a grid-dipper, it can be pre-tuned by simply

shunting a 3' or 4' test-lead at the bottom of the loop. Put a 1-turn half-knot in it to insert the grid-dipper coil. (It may "look" like you're shorting out the test-lead with a big 4" wide dead short, but not-so be-cause of the Hi-Q. Alternately, you can "listen" in general-coverage and note where you get a "noise-peak", or if you're in the ham-bands, you can simply try loading it to experimentally adjust the Gamma for a perfect SWR.

By the way, in case you don't read the reference, I should emphasize that this is a "vertical-loop"...not horizontal. Round is best, octagon is second best, square is 3rd and rectangle is last (Wants to enclose as much "area" as possible for a given perimeter. Good luck!

Source record: 12289

I'm glad you asked! This may not directly solve your problem on CW and
especially on a random frequency, but I am thinking of starting a campaign
to suggest how all "phone nets" can get on precisely the same frequency.
My suggestions are based on the assumption that the large majority of
tranceivers are digital/synthesized, read only to 0.1 Mhz on the main display,
and have the option of tuning in exactly 1 Khz steps where it necessarily
stops precisely on a full digit. My Icom 751 does this and I feel pretty sure
that other similar equipment does the same.
1. Have all nets agree to use a "full" digit (no 0.1 Khz fractions).
2. Have all participants leave their main tuning in the "1 Khz-step" mode
only, to step to the desired digit.
3. Henceforth, DO NOT TOUCH the main dial....use only RIT (Receive
Incremental Tuning, or whatever descriptive term is used).
Thus each person can set his RIT to suit his own personal taste with
only one setting and everyone will automatically suit "his ear"!
Of course all the above depends on the transceiver being precisely calibrated
to WWV, and I suggest the following:
1. Using the same 1 Khz-step mode only, set WWV upper-sideband on VFO A,
and WWV lower-sideband on VFO B so that you can quickly toggle between
them. BE SURE to have your RIT cleared to zero! (Alternately, I set
WWV 5 Mhz in Memory-channel 1 & 2, 10 Mhz in 5 & 6, 15 Mhz in 9 & 10,
using the gaps between sets so as not to accidentally toggle WWV on
two different frequencies, since the transceivers are not absolutely
perfect)
2. Now wait for WWV to send their "musical tone" (not preset during some
intervals), and simply "tweak" your calibrator until your ear tells you
that the two musical tones match, as you toggle quickly between upper
and lower sideband. I feel certain that almost everyone has a good
enough "ear" to recognize when the tones match!
By the way, if you thought you were good at tuning in speech
properly...try first "tweaking" your calibrator until you think
the voice sounds natural (do this before the tone test)...then
use the comparative-tone test and see how many cycles you missed.

Any disagreements? 73 W9RWZ

Will Martin, I saw your post, and thought I would give some of my own perspective on the ARF and other nets that can be heard on 3950 khz.

You either love this kind of amateur radio, or you hate it. I love it, obviously, as you can see from MY signature block, I participate in BOTH nets...

3950 has always been a different kind of frequency as long as I can remember. I once wrote an article (It is lost here somewhere) on the frequency that goes back to the 1960's when I first started listening to this fascinating frequency.

The Amateur Radio Forum, with NR9Q began about three years ago as a spinoff of the "Liberty Net" which is also heard on 3950. Jack had an idea for a more organized discussion group which would be topic oriented, and I would say the net has been quite a success, and has grown in concept to become my favorite net. Thursdays at 10 Eastern (9 central, and you can do the rest) the group gets together to discuss current events, and usually one particular topic.

More recently, Jack has begun to have on Guests, and the amateurs checking in can query them. The guests run the gamut of the political spectrum from the Louis Farakan camp to the David Duke camp... From a scientist at the field museum to a honcho from the ACLU.

I want to stress that these nets are NOT broadcasts. The hams are all in "point to point" communication, even though I know there are lots of SWL's tuned in because the nets are so interesting. Some pretty firey discussions have taken place.

ARF is a lot better than your regular "talk show" ... This is because of the nature of ham radio. There is no way to "hang up" on someone, so everyone gets their say, although there is a 3 minute time limit (hey try and get 3 minutes from Larry King!)...

ARF is not the only such net on 3950. You might also want to check out:
Freeman's Net (Thurs 10PM EST) NCS W9OAG
Devoted to Law, Constitution, History...

Liberty Net (Sat 10PM EST) NCS W1WCR
Devoted to current events and news

Christian Investigator Net (Mon 10PM EST) NCS WA9D
(IMHO Neither Christian Nor Investigative, but somewhat muddled)
A potpouri of somewhat confused religious discussions

Most nights in the late hours, you will hear many discussions on various topics from Psychic Phenomena to Gun Control on 3950. Often the discussions get heated, and it makes for what I consider GOOD HAM RADIO.

3950 is seldom boring. To really sample the frequency before you make up your mind, give it about a week or two of sample tune ins...

And YES you will hear "The Eccentric Old Hippie" from Marquette check in quite often.

When I am there, you will hear USENET discussed. I am the sysadmin of LOPEZ in real life.

Will, you asked one question that I did not respond to in my previous posting...

The Saturday net on 14.313 is NOT a tape, it is a chance for folks who would not normally hear the net get a chance to participate.

You might realize that running a net on 14.313 is a challenge, since at the moment this frequency is a hot bed of confrontation, but that makes it an ideal place to hold a controvercial discussion group.

Mike WA9D has been trying to take over the frequency several saturdays in a row (THE DOG IS BACK FOLKS....)

Surprisingly there have been some GREAT saturday ARF groups...

Hope some of you folks will check in to the Thursday or Saturday ARF nets... the more the merrier....

Ham radio is a heck of a lot more than "Gud luck in the contest"...

Hi everyone,
I have been put in charge of a club project to work some satellite contacts this year during Field Day. I have access to about all of the necessary equipment (rigs, antennas, etc.) but I'm not too knowledgeable when it comes to working the satellites. We (the First State ARC, Wilmington, DEL) will probably settle on mode JL on OSCAR 13. I would like to know about anything that I should watch for, operating hints, etc. In other words, anything that might make this task a little easier for someone who mainly relies on the terrestrial modes of propagation at VHF. Thanks in advance.

This proposal by the FCC is basically going to mess up the entire process
of licensing hams other than General/Advanced/Extra. Perhaps THAT ITSELF
is intended by someone as an incentive to upgrade.

Still, since some people ONLY want the VHF/UHF privileges, they are not
interested in "upgrading" but will be stuck with signing some suffix for
the rest of their lives unless they got the Tech before the change (if we
less this foolish thing go on).

The confusion alone could further reduce the number of new hams entering
the hobby.

2243. Lojack security

Newsgroup: rec.ham-radio
Date: 1990-04-12 05:51:26 UTC
From: die@cpoint.UUCP
Message-ID: <4620@cpoint.UUCP>
Source record: 12298
Cross-posted to: rec.ham-radio,rec.radio.shortwave,rec.autos

In accord with my foolish but "traditional" role as one of the extreme lunatic fringe voices on Usenet who publically speaks the unspeakable about security issues created by clever seeming technology (and finds his articles republished without permission in what seems like almost every hacker/phreak publication as a consequence), I have some questions about Lojack security, now the subject has been broached on rec.ham-radio. (Lojack is a Boston based startup company btw).

Why is it not possible to detect a Lojack equiped car by looking for local oscillator leakage radiation from the command receiver ? I would think thieves would carry suitable receivers with them and either avoid cars radiating on the LO frequency or take special precautions when stealing them (like carting them off in a well shielded enclosed truck - a big Faraday cage). And certainly finding where the Lojack unit was hidden would be easier with a near field sniffer probe and an "S" meter on a receiver tuned to the LO.

And if you know the vehicle is Lojack equiped, why not simply jam the command frequency with a small portable transmitter ? I doubt the command signals from the the Lojack activation sites are anywhere near as powerful as even a few milliwatts radiated right next to the command receiver in the Lojack box (or into the vehicle wiring). And the potential of DF'ing the jamming (and thereby finding the thieves) might be greatly reduced by using lookthrough jamming (only turning the jamming transmitter on for a brief burst when a command packet from the Lojack activation sites is detected). I am sure there are optimum jamming modulations that disrupt the parity on a command packet and render it useless while still retaining a relatively low duty cycle and high off time to on time ratio.

And certainly the well equiped thief would want a receiver tuned to the homing frequency to warn him that the car he was stealing was broadcasting so he could ditch it and get away (after first disconnecting the car battery so the nicad in the Lojack unit would have a chance to run down and stop broadcasting if the police didn't find the car in time).

I suppose the Lojack scheme is useful in the face of these problems because most car thieves aren't very sophisticated. I understand, however, that the kind that steal expensive late model cars (what Lojack aims its marketing at) for parts ("chop shops") are pretty sophisticated and could be expected to use these approaches to defeat the system if it becomes at all common.

But still ...

How about just use calls like WPA3xxxx and WCW3xxxx?

> I think this would appease those who claim "my call is like my name,
> I don't want to change it." (shades of incentive licensing). But,
> just think, if you operate three different modes, you'll have three
> different calls.....just like a - first name - middle name - and
> last name.

So shall I just call you NARATIL? Or maybe WCW3BNRX?

Also, I would like to add a proposal that allows the use of a set of
very short calls for contest operation. The call W3 would be shared
by all contesters in area 3, for instance. Thus an exchange might
go like:

W3 UR 599 QRZ W9

Surely all contesters will love this since the time it takes to make a
contact will be shorter than ever before. And they can program both
calls into a memory unit just like they do now for the signal report.

Better yet, forget call areas and just go with W.

The individual strands of wire in Litz wire are NOT insulated from each other.
Litz wire is essentially LOTS AND LOTS A N D L O T S of very fine (and
sometimes silver-coated) wire all twisted together. Because of the greater
surface area of such wire, it is supposed to have less impedance at RF
frequencies than normal single strand wire. (or wire with only a few strands)
By the way, Litz wire tends to be VERY flexible as well due to the large number
of strands.

Oh, mygod, PLEASE dont't re-misuse QRA for the Maidenhead grid locator.

QRA? -> "What is the *name* of your station."

We (here in Europe) have enough confusion already having to live with
TWO grid systems (the old one and the new one) The old one originally
misnamed the QRA-locator system later renamed the QTH-locator. The new
one here sometimes called the QTH-locator, sometimes called WW-loc or
LOC on CW.

>and dits on the forefinger. Again, I've tried using my left hand with my
>normal setup...and get confused easily, but with it wired exactly backwards
>from my normal mode, I can send just fine.

I had a right hand, left hand CW sending experience somewhat different
from this. Some years ago when I actually used to use CW on the bands,
I normally used my Heathkit keyer. However, I thought it was fun to use
a straight key and that I should keep up my proficiency with it. However,
after being used to the keyer, I had difficulty sending good code with
the key. The old right hand just would not work properly. My CW was
as good/bad as my handwriting (you wouldn't want to try to copy it). I
had a bright idea; why not try my left hand with the key. Much to my
amazement, I am not ambidextrous, I was able to send much better code
with my left hand. So, for a while when I used CW, I would use my right
hand for the keyer and my left hand for the straight key. It worked
pretty well for me. This is also a trick that can be used when someone
has developed a "bad fist" for CW. It amounts almost to starting over.
This offers the advantage of training the other hand correctly. It can
also be used to keep new hams from developing the habit of sending CW
faster than the ability to receive it. This is quite common. By using
the other hand, the speed will be slower, but more closely reflect the
receiving ability of the ham. Try it, you might like it!

Alas, I never use CW now, but should start practicing. My main objection
to CW is I cannot copy by ear and must write down each character. This
probably is a result of my code interceptor MOS in the Army Security
Agency when I copied coded number and letter groups at 40 - 45WPM. You
don't pick up word copying skills this way, just automatically type
the characters on the mill without ever even realizing what you are
copying unless you stop to actually read what you have typed. The only
exception to not knowing what you were copying was the ever present
"QSA ?" inquiries on the net. With it operating 24 hours a day every
day of the year, there were a lot of signal strength inquiries!!

A Heathkit catalog I received from them many years ago (maybe 20?) gave a short history of Heath. It said that Heath did indeed begin its corporate life as a vendor of airplane kits, specifically a monoplane called the Heath "Parasol." There is an example of the Parasol on display in the museum of the Experimental Aircraft Association in Oshkosh, Wisconsin. If memory serves me correctly, the article in the catalog indicated that the Heath Parasol was introduced circa 1929 and that Heath turned to electronic kits after World War II. Taking advantage of a glut of war-surplus electronic components, Heath introduced a reasonably-priced oscilloscope kit.

If this chronology is correct, I must wonder what Heath did during the Depression. Was the market for airplane kits sufficiently large during those difficult times to sustain Heath? Or was Heath in another business between the airplane kits and the electronic kits? By the way, the catalog article to which I refer reproduced a photograph of a Parasol in flight.

Could you imagine how the instruction manual for a Heathkit airplane would have been written? Something like:

( ) Attach inner aileron hinge to left wing with 1/4-20
x 1 1/4 bolts, lockwashers, and nuts at locations
CA and CB (see Fig. 64a, foldout from page 229). Do
not tighten at this time; hardware will be tightened
after installation of aileron.

And the first line of the "Operation" section undoubtedly would have read:

Note: Operation of your Heath Parasol requires that you have
a valid pilot's license. Information concerning pilot licensing
may be obtained from any branch of the Federal Aviation Admini-
stration.

I wonder if Heath sold their airplane kits with the same slogan--you know, the one which says:

"We won't let you fail!"

[several methods of defeating Lo-Jack car-finding, ...deleted]

The trouble with being technical is that we miss the true essence of the Lo-Jack invention. The purpose of Lo-Jack (company) is to create a lot of consumer interest, make a great splash, go public, and get out with a lot of money, Surely, David, living in Boston should make you more sensitive to that... :-)

There is more than one way to make money on stolen cars.

>markz@ssc.uucp

Most lowfer transmitters are designed for 50 ohm output; ordinary
dummy loads work. Very roughly, a 30-foot vertical with 20'tophat
might look like 400 pf in series with 75 ohms, and require 1.8 mh to
resonate. Loading coils are usually coupled to the transmitter by a
tap or link, and are tuned with a variometer (a few turns on a
rotatable form inside the main coil, such that their inductance adds
or subtracts from the total inductance).

Two comments on learning code and passing the code test:

A very effective way to get your speed up is to get involved with CW traffic handling. This way you actually get practice copying ON PAPER rather than just in your head. If you don't know the frequency of your local section traffic net, ask your ARRL section manager (address in the front of every issue of QST).

When you take the test, there is a little-known clue that can help you figure out the parts you missed. Every letter, number and standard punctuation mark must be used at least once in the text. If you copy a callsign as WA_XYZ and you can see that no other 6's have been used in the text, then you know it must be WA6XYZ. Ditto for letters. The unusual letters (Q, X, Z) are hard to use in the text so usually end up on one of the callsigns.

Re: trunk-mounted radios.

I have an old Drake UV-3 144/220/440 MHz radio with romote control head option. It allowed me to mount the rather large radio in my Volkswagen beetle under the rear seat next to the battery (short power leads) with the control head mounted in the glove box. I put a lock on the glove box so that, not only is the unit hard to see, it's hard to get to.

> operation, thus presenting problems with instability).

Many years ago, (like 20!) I built a grounded-grid linear using a pair
of 304TL's. It was a single band unit designed to generate around 1000W
at 3 MHz for an experiment being done by a grad student in the Physics
Dept at Wesleyan Univ (Conn) where I was a student at the time.

I don't remember what we did to stabilize it, but I don't think it was
anything special. I do remember the power supply was a surplus unit
rated at 1800 Volts 1+ Amps REGULATED. (C-V transformer)
It took 4 men and a boy to lift the power supply, but it worked great.

2261. Worlds Best Scanner ANntenna and who REALLY makes it

Newsgroup: rec.ham-radio
Date: 1990-04-12 19:36:29 UTC
From: flash@lopez.UUCP
Message-ID: <1272@lopez.UUCP>
Source record: 12316
Cross-posted to: rec.radio.shortwave,rec.ham-radio

There be egg on this hoser's face. My recent posting regarding the MONITENNA model 5094 stated it is made by Motorola.

This is, of course, wrong. I was brain dead at the time of posting, and am not responsible for my actions.

The antenna is made by CHANNEL MASTER.

It is STILL the best scanner antenna you can buy. it runs rings around a $100 discone (albeit without the wide bandwidth, but in practice it picks up just dandy on frequencies that are not listed in its coverage specs)

The antenna is $40 from a dealer here, I am sure you can find it anywhere now that you know who REALLY makes it. (or write me and I can give you tha name of the local dealer who will mail it to you)

Sorry for the confusion.

I now have TWO of these antennas. I am getting stuff I never knew existed before. I have them at 40 feet and all I can say is WOW....

(Grove's catalog says it is the best antenna, but Grove does not ship it because it is so big, about 5 feet, but it goes fine UPS, I guess Grove's problem is finding storage space)

The antenna comes like an umbrella and includes all hardware, even comes with coax and a plug.

It is a MOTOROLA plug. I think that is where the brain files got linked, and I gave the wrong manufacturer.

Will you EVER forgive me....

Duh.

>frequencies than normal single strand wire.

Oh, really? And how can it have greater (electrical) surface area if all the surfaces are in electrical contact? What keeps the current inside the fine wires and away from the bundle's surface? (Especially if it's silver plated.)

Maybe usage varies in different parts of the world, but around here Litz wire is most definitely made up of many fine wires all enamel-insulated from each other, with each wire brought out to the surface periodically. I had a funny feeling about this, due to some unanswered questions about proximity effect (my experience with Litz wire has been limited to few experimental switching-supply designs), so I looked it up in a couple of electronics dictionaries as well. They both indicated specifically that the wires are individually insulated.

Some additional information, as promised:

Radiokit (store is located at:)
P.O.Box 973 15 Londonderry Rd.
Pelham NH 03076 Londonderry NH 03053
(603) 437-2722
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of parts in general. They seem to want $1 for the catalog.

BCD Electro
P. O. Box 450207
Garland TX 75045-0207
(214) 343-1770
$1 for 1-year subscription to catalogs, no minimum, $0.95 for under $30, $2.90 shipping. Surplus electronics, pretty random looking assortment. I haven't ordered from them (yet).

Oak Hills Research
P.O.Box 250
Luther MI 49656
This is W1FB (Doug Demaw). Send a SASE for a flyer. When last I got a flyer, he had a number of random parts aimed at QRP rig building; he also has a couple of kits for QRP transmitters.

Newark Electronics
Send catalog requests to:
Newark Electronics
ATTENTION CATALOG DEPARTMENT
4801 N. Ravenswood Ave.
Chicago IL 60640-4496
They don't have a single mail address or phone; instead, one is supposed to call the closest of three pages worth of branch offices. I don't feel like typing in the entire list (it's copyrighted, anyway :-), so send email for your "local" distributor, or you can try calling one of the above numbers... They have a $25 minimum order; while they are a Real Distributor, and are probably most comfortable with gigantic orders, they say they welcome every customer, regardless of size, and were certainly happy to take my $30 order recently. They carry LOTS of stuff; in particular, semiconductors from Motorola, RCA, Sprague, TI, American Power Devices, Fagor, GE, International Devices INC, Intersil, International Rectifier, Precision Monolithics, Powerex, and others. They are very complete, except, of course, for my favorite scarce item, the air-variable capacitor...

And lastly, check out

NUTS & VOLTS MAGAZINE
P. O. Box 1111
Placentia CA 92670
1-800-783-4624 (subscriptions)
~80 pages each month of nothing but electronics classified ads. Individual issues are $2.00 (at least, that's the price on the cover), subscriptions are (third class mail, USA:) $12/1 year, $21/2 years, $60/life, (first class mail USA) $20/1 year, (Canada/Mexico) US$22, (other foreign, air mail) US$55. A subscription also entitles you to one free classified ad of 40 words.

I think I've run out. Anyone else?

>or just above there.

In my experience, the only place to find people using 40 wpm+ cw is in the US novice bands. These people are not necessarily novices. Also IMHO, the people just above the US extra CW only bands usually are going about 20-30 wpm. I have found most extras creeping along at only 15-18 wpm, in the extra CW only bands.

The WB2OPA LogMaster HF logging system for IBM PCs and compatibles will
be demo'ed at the Sensible Solutions booth (#474), at the Dayton HamVention.

Amongst its many features are

o Automatic beam headings.

o QSO alert indicator to tell you if you need the QSO based on country,
state, prefix, cq zone, itu zone or any combination for the
current frequency and mode.

o Auto dupe checking.

o Metric to english/ english to metric conversion calculator.

o Prints high quality QSL cards.

o Keeps award statistics.

o User configurable.

o And much, much more.

Please drop by and say hello!

From: weber@cg-atla.agfa.com
Message-ID: <8595@cg-atla.agfa.com>
Source record: 12323

(sorry for any violations to this net's protocol)

WANTED:

Portable all-band receiver (like the old Zenith Trans-Oceanic)
Should be rugged and run off internal batteries.
Ability to run off external 12vdc (ship's power) would be a plus.
Normal broadcast FM, common short wave and ham freq a must.
Marine VHF would be a plus but not required.

I will use it for entertainment and WWV reception this summer on my
summer off from work (gone sailing).

I'm not able to find too many reasonable NEW ones about. I know about
Radio Shack at $200 & $90 but have always been underwelmed by their products.
Their $200 radio seems ok, but not great (not at $200).

Offers & ideas......

Stranded wire has less skin-effect resistance than the equivalent
solid wire, but much more than true litz wire with individually-
insulated strands.

Some large/expensive stereo speaker cables are being marketed as
"Litz" and are made of many very fine (but not individually insulated)
strands.

Skin-effect resistance can be significant in large-diameter conductors
at audio frequencies. Whether it makes noticeable difference over the
length of speaker cables is another interminable argument for
rec.audio (like the one about mercury-filled plastic tubes which were
supposed to give your speakers a more "fluid" sound. :-)

Here's a list of AWG copper wire sizes and their "critical
frequencies" (frequency above which skin effect causes resistance to
be significantly greater than DC resistance). I don't know the
criteria for "significantly greater." The table partially reproduced
below was in the Canadian LF/VLF newsletter _Northern Observer_ issue
#9 (April 1989).

AWG dia. critical
size mm freq.
---
1 7.35 586 Hz
2 6.54 738

4 5.19 1017
6 4.12 1.87 kHz
8 3.26 2.97
10 2.59 4.72
12 2.05 7.50
14 1.63 11.9
16 1.29 19.0
20 .812 48.0
22 .644 76.3
28 .321 307
32 .202 775
36 .127 1.96 MHz
40 .080 4.96

In addition to skin effect, wire resistance can increase by "proximity effect" where a strong magnetic field forces the current toward one side of the conductor. That's a reason why some cyclotron magnets are wound with flat "wire."

Why is it that the ability to copy Morse Code onto paper is the desired goal?
Are there any cases of need to copy voice onto paper?

Well, of course one would copy radiograms onto paper, whether sent by voice
or sent by Morse Code. And there is a provision on the code test whereby
a minute of solid copy passes the test.

I just don't see why I need to be burdoned with the concept of actually
copying code to paper. What is wrong with copying code in your head just
like you do voice?

> Does the ARRL insurance cover mobile rigs if they are thieved while
> in someone else's car? Quoting from the info pamphlet "Your
> equipment & accessories are covered in your car as well as your home."

Apparently not. Don't loan equipment or even borrow equipment as it is
not covered under these circumstances by this policy. Some homeowners
or renters policies will cover things under some circumstances that the
ARRL policy will not. You need to shop for your insurance both on the
basis of rates AS WELL AS ON THE BASIS OF TERMS. You need to see the
actual policy wording. Insurance salemen don't like to get this information
to you until you are sold, though, so you will need to push them for it.

> Can I schedule general purpose test gear like scope's, dmms?

I doubt it. The plan does cover computer hardware associated with
your amateur station, and up to $1000 worth of software (provided of
course you list the items and pay the appropriate premium).

> Whenever I try to phone the administraters of the plan,
> A.H. Wohlers & Co, to ask them directly, I always get a busy signal.

Which number are you calling? Of course I bet they are real busy these days.

SB RTTYDX @ RTTYDX $RTDX1304
RTTY DX Notes, 1of3, 4/13/90

RTTY DX Notes for Weekending 13th April 1990.
Part 1 of 3.
BID: $RTDX1304

I would like to repeat some comments that I have made before. It
concerns the removal of the Bulletin Identification Number (BID
number) of these notes. It has been reported that in some instances
the BID number has been removed and replaced with a local BID number.
This has caused confusion, and some bbs suffer the multiple delivery
of the DX notes with different BID numbers. Please only pass on the
received BID number. If you cannot do this, then allow someone else
who can pass on the correct BID to do so. Then of course we have the
stations who remove the opening stanza and the credits as well as the
signoff, and pass the notes along as (my) DX notes for the week.
Chaps, if you think that you can do a better job, please let me know
and I will let you do the whole thing. A happy Easter to you all.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1ACB, JA1BLV, OD5NG,
TG9VT, VK2EG, W1DA, W2JGR, W0LHS and the Tri-State DX Association VHF
packet cluster. Thank you all for your information and interest. May
you all have a happy and DXing Easter.

QSL Information:

SU1HN is Hamed Hassar, Box 1578, Alf Naskah, Cairo, Egypt.

TA3D is at Box 963, Ismir, Turkey.

FM5WD QSLS via W3HNK.

KP2N cards go to K8OHC.

XV0SU says to QSL to Box 308, Moscow 103009, USSR.

4U1UN was operated by NA2K, and he will look after the cards.

PZ1BS says to QSL to Box 831, Paramaribo, Surinam.

S92LB QSL address is Box 147, Sao Tome.

YI1BGD says to QSL to Box 7075, Baghdad.

YV0AA will QSL via Box 2285, Caracas 1010-A Venezuela.

Notes Of Interest:

ZL1AMO: It was reported that ron would be active from this week for a two week stint on ZK2RW, but so far no sign of him.

Jarvis should start this weekend with the call of either AH3C/KH5J or AH3C/KH1J, from the 13th through to the 23rd. No reports so far.

XV0SU: Alex reports that Spratly should start up next weekend for a two week operation.

Remember the St. Peter and St. Pauls Rocks operation last year signing ZY0SY? They had only 37 contacts before their computer blew up. So far they have received only 22 cards. If you worked them and have not received a card, send your request to Natal DX Group, CP597, 59021 Natal RN, Brasil.

Nothing has been heard from Burma as yet. Keep your fingers crossed.

Have a happy Easter with lots of good DX.

GL DE DX1 (VK2SG) VIA TG9VT.

SB DAYTON @ RTTYDX $KT7H0413
Digital Suite at Dayton!

BID: $KT7H0413

Looking for a place to meet fellow packet and RTTY hams at the Dayton Hamvention? On Friday night I will be hosting the Digital Suite in room 425 at the Downtown Stouffers. This will also be a place for USENET and Fidonet (landline BBS) hams who have been looking for a Dayton meeting spot.

This will be for Friday night only, BYOB, non-smoking. If you forget the room number (425), look for signs next to the elevator in the lobby.

DON'T FORGET! STOUFFERS, ROOM 425, FRIDAY APRIL 27TH!

73,

Tad

2278. Re: Repeater on Space Station Freedom

Newsgroup: rec.ham-radio
Date: 1990-04-14 17:57:07 UTC
From: hburford@enprt.Wichita.NCR.COM
Message-ID: <636@enprt.Wichita.NCR.COM>
Source record: 12183

davet@tsdiag.ccur.com (Dave Tiller N2KAU) writes:

>Has anyone petitioned NASA to have the first Amateur repeater on Space
>Station Freedom? I'd love to have my call broadcast for all those
>David E. Tiller davet@tsdiag.ccur.com | Concurrent Computer Corp.

I like the idea! I would be in support of such a project. There
are some issues, however ....
1. Since it is Amateur radio, there will certaintly be some
antenna height restrictions imposed <g>
2. Since it is Amateur radio, it will be the first thing to be
blamed for TV problems everywhere.
3. Unless it is promoted well, everyone will call it a CB.
4. It will be necessary to have a control operator onsite.
5. How do you handle phone patches? MCI would like a per mile
charge for long distance.

- keep us posted on your proposal status ...

Do the people who invent these snake-oil audio scams ever get rich?
I was just thinking that exposure of some speaker wire to intense radiation might shoot some imperfections into the crystal lattice, to create more conduction between layers of copper atoms. Just the thing to get a deeper, more thundering bass and to sharpen the points on those highs.

2280. TS930s Problem

Newsgroup: rec.ham-radio
Date: 1990-04-14 20:33:51 UTC
From: katz@weyr.FIDONET.ORG
Message-ID: <635.26279072@weyr.FIDONET.ORG>
Source record: 12185

I have a TS930s with antennae tuner. Lately, as I am sending cw I have noticed that the ALC starts to drift lower so I turn up the carrier and it keeps drifting down until I lose that ALC. Can anyone give me any suggestions as what to look for or do? PS: I have never had to turn the carrier up to maximum. Sooner or later I fid a point usually a little over half way where the length of the QSO is less than the drift. Also, if I do not key the transceiver for a while the ALC is up to high and I have to turn

the carrier down. I have soem ideas about the problem but I would like some other opinions. Thanks!

ALL BAND PORTABLE RECEIVER
You might wish to give the Sangean ATS-803A a try. Sangean has come a long way over the past year. This portable --generally-- lists for around $189.00. Complete with keypad, memories, BFO and clock. Also manual tuning as well as "keypad tuning." An excellent performer for the price. This --of course-- is just my opinion.

P.S. Digital frequency readout is standard.

Havana Moon

2282. DAYTON!

USENET MEETING PLACE AT DAYTON HAMVENTION

It's that time of year again! Year after year we see postings on
USENET asking, "Where can USENET radio afficinados get together for
an old fashioned eyeball at the Dayton Hamvention?"

In 1990 we have a place of our own.

Come to the Digital Suite on Friday, April 27 at the downtown Stouffers
Hotel, room 425. I have a large suite reserved for packet, RTTY, USENET
and Fidonet hams, so we can all get together and see what each other
looks like (scary!).

This is at Stouffers, where many of the DX clubs host the infamous
hospitality suites. . .where you can gab with famous DX and contest
hams until the wee hours. And now we have our own hospitality suite!

Show up after 8pm, room 425, downtown Stouffers in Dayton, April 27th.

BYOB and non-smoking, please.

See you there!

2283. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-04-15 01:31:14 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9004150738.AA15465@ucbvax.Berkeley.EDU>
Source record: 12188

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

MONDAY APRIL 16, 1990

SpaceNews is published and distributed weekly around the world on USENET
and Amateur Packet Radio. It is available for unlimited distribution.

* RUDAK-2 *
===========
RUDAK-2 has now been integrated into a Soviet Geological research satellite,
GEOS, scheduled to fly in July. RUDAK-2 will not only carry a Mode B linear
transponder but also a variety of packet radio experiments with data rates
from 400-9600 bps using various modulation schemes. It will be compatible
with AX.25 protocols and those amateurs equipped for FO-20, PACSAT, LUSAT,
AO-13 PSK telemetry, and UO-14.

Linear Transponder Uplink: 435.030 - 435.120 MHz (90 KHz)
Linear Transponder Downlink: 145.880 - 145.970 MHz (inverted)
O/P Power: 12 watts max.
Beacon : 145.880 MHz, CW telemetry.

Gain of satellite RX/TX antennas: 2.3 dBi each (dipoles)
Input sensitivity: -125 dBm (435 MHz) for a C/No of 45 dB/Hz

SAT-RX-1: 435.016 MHz +-10 KHz 1200 bps, FSK, NRZIC/Biphase-M (JAS, PACSAT)
SAT-RX-2: 435.155 MHz +-10 KHz (AFC) 2400 bps, BPSK, Biphase-S
SAT-RX-3a: 435.193 MHz +-10 KHz (AFC) 4800 bps, RSM, NRZIC/Biphase-M
SAT-RX-3b: 435.193 MHz +-10 KHz (AFC) 9600 bps, RSM, NRZI (NRZ-S) +Scrambler
SAT-RX-4: 435.041 MHz +-10 KHz (digital AFC) RX for RTX-DSP experiments

The downlink can be switched to the following operating modes:
Transmit frequency: 145.983 MHz

Mode 1: 1200 bps, BPSK, NRZI (NRZ-S) (like FO-20)
Mode 2: 400 bps, BPSK, Biphase-S (AMSAT mode for OSCAR-13 beacon)
Mode 3: 2400 bps, BPSK, Biphase-S (planned for OSCAR-13)
Mode 4: 4800 bps, RSM, NRZIC (Biphase-M) (like 4800 bps uplink)
Mode 5: 9600 bps, RSM, NRZI (NRZ-S) + Scrambler (like 9600 bps uplink)
Mode 6: CW keying (only for special events)
Mode 7: FSK (F1 or F2B), e.g. RTTY, SSTV, FAX, etc. (only for special events)
Mode 8: FM modulated by D/A signals from DSP-RISC processor (e.g. speech)

RUDAK-2 is a joint project of AMSAT-U-ORBITA, the Adventure Clubs in Moscow and the AMSAT-DL/RUDAK Group in Marburg, Munich and Hannover.

[From DB2OS and DJ0HC/KE6MN via OSCAR-11]

* STS-31 NEWS *
==========
NASA managers set April 25 as the new target launch date for STS-31. This date is based on the decision to remove and replace Auxiliary Power Unit (APU) No. 1 on Space Shuttle Discovery and to allow time for recharging the Hubble Space Telescope (HST) batteries. The decision to replace APU #1 comes after examination of the APU controller by the manufacturer, which verified that no problems existed within the controller.

A new APU will serve as the replacement APU on Discovery. The recharging of the HST batteries will be accomplished by removing the batteries from the telescope and charging them in a laboratory. This allows the batteries to be serviced under the most favorable conditions while HST remains in the clean environment of the shuttle's cargo bay.

2285. DAYTON!

Newsgroup: rec.ham-radio
Date: 1990-04-15 09:38:58 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500500@ux1.cso.uiuc.edu>
Source record: 12190

Dayton is getting closer. Here are the suggested frequencies whereby rec.ham-radio and info-hams people can communicate. Of course there will be lots of QRM especially at the Hara Arena on 2 meters. Three frequencies are suggested just in case someone is stuck on one band.

223.600
445.600
145.600

If you can get on 223.600, that should be the first place to try. Second will be 445.600, and finally if you must and can get through, go for 145.600. The first of these frequencies was suggested a while back and I added the UHF suggestion then. With this posting I am adding the 2 meter suggestion for those stuck on that band.

PL 118.8 (2B)

If you can transmit a PL/CTCSS tone, I suggest everyone use 118.8 hz (2B). That way those of us who can do tone squelching can cut out some of the QRM. This will be especially useful for those who are stuck on 2 meters.

Outside of the Hara Arena, simplex might not hit everybody. Perhaps you can try all three bands depending on your capabilities. The fallback is to call on repeaters. I suggest the primary keyword to say and to listen for be "usenet". Others such as "rec ham radio", "fidonet", and "info hams" might work, but might also be a bit more misleading to others. Due to the low number of repeaters for the significan ham crowd in Dayton, suggesting a particular one would probably be futile.

--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society
<phil@ux1.cso.uiuc.edu> | no matter what the particular issue is all about.

2286. 2-meter Au Beacon

Newsgroup: rec.ham-radio
Date: 1990-04-15 14:24:06 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <9004170705.AA25939@ucbvax.Berkeley.EDU>
Source record: 12191

VHFers:

The W9IP/BCN Aurora beacon has changed frequency. It is now
transmitting in the new 2-meter beacon band, at 144.294. Please
pass the word to other VHFers who might use the beacon for Aurora
propagation monitoring.

The beacon runs about 40 watts output, CW,
to a 5-element beam which is pointed north. The site is on a fine
hilltop about 10km from my QTH in Canton, NY (grid FN24). Transmission
is unattended, signing "de W9IP/BCN FN24" followed by about 5 seconds of
tone. The signal has a slight chirp. Reception reports are welcome.

If one of the astronauts is a ham, maybe he might have the repeater pair put into his spacesuit radio, for occasional ragchews? Of course, he can't spend much time talking, he has his work to do.

2288. RFI to Entertainment Devices

Newsgroup: rec.ham-radio
Date: 1990-04-15 19:00:44 UTC
From: jim.grubs@w8grt.fidonet.org
Message-ID: <XZNoH1w161w@w8grt.fidonet.org>
Source record: 12193

By: Thomas Nofsinger
To: REC.HAM-RADIO
Re: RFI to Home Entertainment Apparatus

If the guy is using coax to go to his speakers, run the coax through a paper towel tube (core), placed as close to the speaker as possible. Cap one end of the tube and then fill the tube with metal filings &/or steel wool. Then cap the other end. This should make a fair RF choke (see page 40-6 in the 1990 ARRL Fanbook, Fig. 6 for an idea of how this may look. Chapter 40 is the Interference section.) I have done this, and the more metal you can pack in around the coax the better. Also, line the inside of the speaker with metal sheilding of some kind. Tom Nofsinger, N5FHZ.

I am looking for an old friend of mine whom I lost
contact with 8 years ago while I was living in Korea.
His name is Geert and his Belgian call-sign was ON7LG.
He was working with ITT as an system engineer in Korea.

Could anyone who knows him help me to meet him again?
Please e-mail me if you could help me.
Thanks. 77&88.

Someone in Japan sent me the April Issue of CQ Ham Radio. It came with
a small booklet Called "HAM Packet Radio News". In page 8 of this
booklet there is an English headline thats says:

Packet Radio in JA N3EUA Bdale Garbee

The rest of the page is in Japanese hieroglyphics. Is this the same
Bdale as posts to this news group? Does he write in Japanese?

I think we should be told.

Yours

A couple of years ago I paid $2.00 for a brand new Lear Siegler "Earcom" control box. It was such a deal, I couldn't pass it up, even if I didn't have a radio to use it with. It came in a Poly bag, but had no documentation or wires.

An Earcom is a device much beloved of SWAT teams and the Secret Service. It uses an earpiece of the "Shove it in yer ear" type that was the standard when hearing aids had tubes. The earpiece is connected to a belt mounted box (The Earcom unit). The Unit is then plugged into a walkie-talkie. Now you can hear in the earpiece, and when you want to talk, you push a momentary toggle switch which keys the radio and allows the earpiece to be used as a mike. I don't know how bad these things sound. I am pretty sure that they would be amusing in VOX mode cos burps, swallows etc should key the mike.

Anyhow, I do not have the earpiece, I need specs or a source. I would also like the pinout for the 4 pin Amphenol connector that seems to go to the radio. The earpiece would plug into an RCA audio jack. The thing seems to be powered by a standard 9V battery (PP9).

So if you have info, phone numbers, sources etc I would be delighted. The Numbers on the Unit are: Model 1105 Serial 4981HW Logo is LSI. Box is blue anodized aluminium.

QEX - The ARRL Amateur Radio Experimenter's Exchange
Gateway Column, Edited By Stan Horzepa, WA1LOU, April, 1990 - P 1 of 5

NEW TNC 2 FIRMWARE AVAILABLE

Tucson Amateur Packet Radio (TAPR) released TNC 2 firmware version 1.1.7. This new firmware release offers significant changes and enhancements including:

o Prioritized acknowledgment (PriACK) protocol

o Improved channel access methods (similar to "persistence")

o Improved compatibility when running AX.25 V1 (T3 may be disabled)

o Filtering to inhibit monitoring of NET/ROM, ROSE, TCP/IP and other networking packets

o Improved transmit timers (time- and/or character-based) and quick-release of PTT at the end of a frame

o Pre-frame synchronization of zeroes instead of flags for reduced TXDELAY (to permit other stations to lock onto your transmissions faster)

o No dead-time between frames during multi-frame transmissions

o Improved KISS operation in the full-duplex mode (for Microsat and other applications)

o Improved RR/RNR buffer to provide "full-handling" for less channel congestion

o Improved modem demodulator calibration facilities

o Additional error (Health) counters

o Documentation of the format and location of the default parameters in EPROM for those who prefer a custom EPROM instead of trusting battery-backed RAM for remote site locations

Details of this new release of firmware is available from TAPR at PO Box 12925, Tucson, AZ 85732, telephone 602-749-9479. The firmware is also available as a binary file that may be downloaded from CompuServe's HamNet.

PACKET-RADIO SATELLITES STATUS REPORT

DO-17 Popular On 2-Meters;
AO-16 and LO-19 Cross-Band Digipeating

Week seven at the AMSAT satellite factory finds each satellite closer to full commission for general use. DO-17 continues to excite newcomers to the world of amateur satellites with its ease of telemetry reception. Anyone with a 2-meter FM receiver tuned to 146.825 MHz, a 1/4-wave ground-plane antenna, and a standard TNC can receive telemetry packets from DO-17. By listening from 0800 through 1300 and 1900 through 2400 local time, several DO-17 passes may be monitored.

DO-17 transmits packets for approximately 2.5 minutes followed by an "off period" of approximately 30 seconds. As is true with each of the Microsats, the telemetry offers 59 telemetry points and the AMSAT Software Exchange has programs available that translate the data points into more easily recognizable information, ie, battery voltage, solar cell current, etc.

AO-16 and LO-19 have been available for digipeating packets. Numerous stations have successfully connected to "DX," as far as VHF-packet-radio operations are concerned, via these two birds. The store-and-forward capabilities of AO-16 and LO-19 have yet to be enabled, pending further testing.

The modulation protocol on these two birds requires using an external 1200-baud PSK modem instead of the FSK modem that is standard in commercial TNCs. To access AO-16 or LO-19 requires approximately 100-watts EIRP FM. Your downlink receiver must be set to USB or LSB. To digipeat through AO-16, you must use the address "PACSAT-1"; to digipeat through LO-19, use the address "LUSAT-1." The downlink and uplink frequencies of AO-16 and LO-19 are as follows:

AO-16:
downlink 437.025, 437.050 MHz
uplink 145.900, 145.920, 145.940,145.960 MHz

LO-19:
downlink 437.150, 437.125 MHz
uplink 145.840, 145.860, 145.880, 145.900 MHz

First TCP/IP Microsat QSO?

Bob McGwier, N4HY, and Jon Pearce, WB2MNF, lay tentative claim to the first Microsat TCP/IP QSO. They were on the 0307 pass of LUSAT on March 3. Since they were both calling each other, they had two Telnet and one FTP sessions. To use the satellite as a digipeater, the NET ARP entry is ARP ADD (your call sign) AX25 (your call sign) LUSAT-1 (for LUSAT, of course). You also need a ROUTE for (your call sign) to your KISS port.
(Continued Next Message)

PACKET-RADIO SATELLITES STATUS REPORT (Continued)

WO-18 Shoots The World

Chris Williams, WA3PSD, reports that the Ground Command Station at Weber State University (WSU) is receiving pictures from space daily. This past week, the best picture taken was of the coastline of British Columbia near Vancouver Island. Since Weberware 1.0 can recover the color in pictures from the imaging data stored in memory, the oceans show up with the proper hues as seen by the camera. Initially, it was difficult for the WSU students to pinpoint the area snapped by the camera, but checking the satellite tracking software and the time the lens shutter was opened, they figured out that it was the BC coastline. The camera on WO-18 can only take a 170-square mile picture when looking straight down, so, at times, one has to be very good at geography to figure out what the pictures represent.

The integration of horizon sensor readings into the picture taking software on-board WO-18 will indicate when the satellite is pointing at the earth. The software is being changed so that pictures will only be taken at those times. This will mean an end to pictures of deep space or the sun.

WO-18 may be heard on 437.100 MHz (+/- 10 kHz for Doppler shift). The alternate frequency is 437.075 MHz.

WA3PSD also announced that the beta test version of the picture processing software, Weberware 1.0, will be sent to a group of carefully chosen software testers, who will perform intensive checks of the software. If no major bugs are discovered, radio amateurs can expect Weberware 1.0 to be available from the AMSAT Software Exchange approximately the first week of April. WA3PSD wants to emphasis that the priority at WSU is taking care of WO- 18. Second priority is getting the image processing software finished. The students at WSU are working as quickly as possible to get this very complicated program into a user friendly state. Weberware 1.0 will run on IBM\R AT clones equipped with EGA or VGA monitors.

Because of the instant popularity of WSU's efforts in building the Webersat, many grade school and high school students from the greater Ogden and Salt Lake City areas are showing up at the Ground Command Station to experience the care and feeding of an OSCAR satellite. The WSU students have enthusiastically embraced the job of explaining to all the finer details of WO-18 and its many on-board scientific experiments. Hopefully, many of these young people will not only become interested in Amateur Radio, but also start thinking about space.

The Webersat team encourages all radio amateurs to continue to save picture data and telemetry from WO-18. To receive a beautiful QSL card from WSU, send your QSL card, a copy of WO-18 telemetry and an SASE to Chris Williams, WA3PSD, Eng Tech Bldg, #236, Weber State University, Ogden, UT 84408-1805.

FO-20 In Full Mode

FO-20 is now operating in "full mode," ie, both transponders (JA and JD) are functioning. If necessary, the transponders will be shut down on Wednesdays. If the JD transponder are shut down, all posted messages will be discarded

without warning.

UO-15 Problem Undergoing Diagnosis

Volunteers at the Stanford Research Institute (SRI) have been working with the University of Surrey (UoS) to find what is preventing UO-15 from downlinking telemetry. Martin Sweeting of the UoS reported that SRI is making a 150-foot dish antenna and its sophisticated signal processing equipment available to figure out if any of the sub-systems on UO-15 are still operational. SRI has aided UoS in the past by using the same dish to uplink a signal of "sufficient strength" to overcome the desensing of UO-9's command receiver by its 2-meter transmitter.

SRI is trying to receive the local oscillators' signals on board UO-15. The calculated received signal strength of UO-15's LOs is approximately -160 dBm. A trial run receiving LO signals from the healthy UO-14 was successful, although it required signal analyzers using FFT techniques to provide a 1-Hz resolution bandwidth over a 5-kHz bandwidth to discern the signals. SRI now will try to locate UO-15's LO signals and, from the results of those efforts, the UoS's engineering team will determine if it is possible to "pull the cork" on UO-15's transmitter.

TAPR ANNUAL MEETING REPORT

The annual meeting of Tucson Amateur Packet Radio (TAPR) occurred on February 24-25 in Tucson. The board of directors met on February 23 and announced the results of the election for the board with the following members being elected to three-year terms: Tom Clark, W3IWI; Pete Eaton, WB9FLW; Don Lemley, N4PCR; Harold Price, NK6K; and Dave Toth, VE3GYQ. The board also selected the following as TAPR's officers for one year terms: Lyle Johnson, WA7GXD, president; Harold Price, NK6K, executive vice president; Bob Nielsen, W6SWE, vice president/member services; and Greg Jones, WD5IVD, secretary/treasurer.

Saturday morning, there were talks on Microsat by Doug Loughmiller, KO5I; TAPR version 1.1.7 TNC 2 software by Lyle Johnson, WA7GXD; TCP/IP by Phil Karn, KA9Q; HF packet-radio diversity by Steve Hall, WM6P; high-speed networking by Bdale Garbee, N3EUA; and the OMNITRACS communications vehicle by Franklin Antonio, N6NKF. The afternoon session had talks on TexNet by Harry Ridenour, N0CCW, who mentioned that TexNet is now available as firmware for the TNC 2. Other topics included Great Lakes (GL) Net by Jay Nugent, WB8TKL; a 56k-bit/s repeater by Doug Yuill, VE3OCU; ARRL happenings by ARRL Southwest Division Director Fried Heyn, WA6WZO, and ARRL headquarters' Jon Bloom, KE3Z.

Amateur Radio manufacturers in attendance also made presentations. DRSI presented their K3MC "Awesome I/O Card," a 56001-based DSP PC packet-radio card, which will operate at 24 MHz. It includes a 16-bit A/D converter

on-board and will cost approximately $400. PacComm talked about their PSK-1 modem, which is a fully-assembled modem for satellite work, and the G3RUH modem. Kantronics presented their Data Engine (DE), the DVR 2-2 VHF transceiver, and the 2/70 power amplifier for the DVR 2-2. WA7GXD reported on the progress of the TAPR packetRADIO.

Outgoing TAPR president Andy Freeborn, N0CCZ, closed the meeting with the financial report for 1989. Afterward, Pete Eaton, WB9FLW, presented Andy with a plaque from TAPR expressing the organization's appreciation for all Andy's work over the years and especially for his service as president.

SAREX-2 TESTED

In late February, the Shuttle Amateur Radio Experiment #2 (SAREX-2) packet-radio station underwent extensive testing at the Marshall Space Flight Center in Huntsville, Alabama, according to AMSAT Area Coordinator Ed Stluka, W4QAU. This testing was in conjunction with the training of STS-35 Payload Specialist Ron Parise, WA4SIR, in the use of the ASTRO-1 experiment, which will be primary payload on that shuttle mission. The primary payload, ASTRO-1, will be used to conduct astronomical experiments. During several days of testing, radio amateurs in the Huntsville area were able to connect to WA4SIR and to receive a QSO number.

This special packet-radio station will fly on STS-35 on May 9, 1990, and will give each radio amateur who connects to WA4SIR a QSO number confirming the contact. When the connecting station sends in a QSL card and the contact number, the station will receive a beautiful QSL card commemorating this "Ham In Space" shuttle flight.

The SAREX-2 packet-radio station has a Motorola 2-meter FM handheld transceiver with 5 watts output, a Heathkit HK-21 TNC 2, and a Grid laptop computer with a 40-Mbyte hard disk drive to store the calls of the stations connecting to WA4SIR during the nine-day mission. The specially written software, which will be running the SAREX-2 packet-radio station, allows completely unattended operation and logging of the calls of the connecting stations. It will also prevent duplicate QSO numbers from being sent.

Although no digipeating will be allowed through SAREX-2, connecting to this packet-radio station will be like any terrestrial packet-radio contact. Just use your TNC with your 2-meter transceiver, and everything else is the same. After you have connected and received your QSO number from WA4SIR, on subsequent orbits you can monitor the SAREX-2 message beacons that will be sent periodically. The message beacons will contain information about the flight of STS-35 and other interesting items.

from AMSAT News Service

PACKET-RADIO DISTRIBUTED BBS OPERATIONAL

The February issue of the Association of Computing Machinery's Communications features a long article from a group at MIT who have implemented a "distributed" BBS as a "Community Information System" (the Boston Community Information System or BCIS) using packet radio and personal computers.

The way the system works is simple. Data from The Associated Press, the New York Times and even feeds from USENET are "broadcast" via an SCA subchannel on a local FM broadcast station at 4800 bauds using FSK. Local packet-radio adapters (TNCs) receive the data using a protocol that is much simpler than AX.25 or TCP/IP. They pass the data on to the user's personal computer, which sees if it is of interest to the user by checking it against a "filter" list generated by the user. If it qualifies, it stores the data on the personal computer's disk and the user can retrieve it using database-style query techniques. This process is called the "simplex" portion of the system, which overall is called a "polychannel" system.

Should a user query for something not in the local disk database, an autodial modem accesses a "local" database server to ask for the requested information (this is the "duplex" portion). Because the local users have no authorization to initiate transmissions on a commercial broadcast channel, dial-up modems are used.

The idea sounds a lot like the distributed ham PBBS in use in Japan. Which leads us to the $64 question: why can't our local ham PBBSs work in a similar fashion with our current PBBSs becoming "servers" (and even gateways to USENET or the Internet)? These would be accessible directly by packet radio instead of dial-up modems and our local TNC/computer combinations would become the recipients of data of interest to us.

from Bill Meahan, WA8TZG

AMIGA, ATARI AND UNIX VERSIONS OF KA9Q'S TCP/IP SOFTWARE AVAILABLE

Version 900214 of the KA9Q TCP/IP software package for the Commodore Amiga computer may be obtained by downloading it from Data Library 9 (DL9) of CompuServe's HamNet. Its file name is AMIGAN.ZOO.

The latest PE1CHL release of the KA9Q TCP/IP software package for the Atari ST computer may be obtained from Mike Curtis, WD6EHR, 7921 Wilkinson Ave, North Hollywood, CA 91605-2210 by sending two blank double-sided or three blank single-sided disks, a postage- paid, self-addressed disk mailer and a note stating your needs.

The UNIX version of the KA9Q TCP/IP software package is available via anonymous FTP from host vax.cs.pitt.edu in the file pub/ka9q/net-unix.cpio.Z.

from Julian Macassey, N6ARE, and Bob Hoffman, N3CVL

W1HUE AND POLI CHANGE ADDRESSES

Larry East, W1HUE, the US distributor of "APR," the public domain packet-radio terminal program for the Apple\R II family of computers, has the following new address: PO Box 51445, Idaho Falls, ID 83405-1445. (APR may be obtained by sending Larry a blank 5-1/4 or 3-1/2 inch disk and a postage-paid, self-addressed disk mailer.)

Packeteers Of Long Island (POLI) have the following new address: PO Box 11, Jericho, NY 11753.

PBBS RESTRUCTURING

(The following is in response to Barry McLarnon's article entitled "Restructuring of the Packet Bulletin Board System Proposed" that appeared in the January 19 issue of Gateway.)

Barry McLarnon's article was right on the money. It points to something I have been after for several years, ie, adoption of the RFCQ822/1022/X.400 standard internal headers for packet-radio messages.

In the past, the From: and the PRMBS's reply To: fields have shown their usefulness. If we try to assemble our bulletin distribution system into a USENET-like system, we need to add the field Newsgroups: to the internal headers. Also, if we can add a Keywords: field, if desired. The point is that we will not need massive software recoding each time we want to add a feature. We only have to add a field.

The PRMBS code already has "mail" and "message sweeper" functions that performs some of the "readnews" function of USENET. I only have to add code to allow it to select and reject articles by newsgroups.

For now, I suggest that we extend the To field. We can put in an internal header with a well defined (20 or more bytes long) field name for the newsgroup, eg, "space.amsat.microsat" or "space.amsat.dove," and use the convention of a major group name with a maximum of six characters, eg, AMSAT. A message that is forwarded to a system as follows:

SB SPACE @ ALLUSA < N4HY $AMSQ700

would be rejected if a system does not want "SPACE" stuff (it would be nice to have the ability to reject subparts of that thread, but that cannot be done without the code getting cumbersome). The sending system does not have to know what newsgroups each system will accept or reject. Instead, the receiving SYSOP configures the system to accept/reject any group. It can be done better, but this is what is possible in the immediate future. (I could add and activate this feature into PRMBS in less than a week and it would have no impact on the network in terms of incompatibility.)

One problem is that in many areas there is insufficient decentralization and linear progressions for mail passing. If some SYSOPs decide not to accept a certain newsgroup, it would stop the distribution of the group. To avoid

this, I would add code to PRMBS to allow generation of the redistributed messages, but hide the original from view on the rejecting system until those messages were fully distributed.

This turns us to the problem of network topology. We have to do more "hubbing," ie, getting more, lower powered stations clustered around one or two more powerful stations that talk to similar stations and distribute the mail on backbone channels and onto secondary backbone channels to clusters, who allow users to log on via a third channel.

from Brian Riley, KA2BQE

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail or or electronically, via CompuServe to user ID 70645,247 or via Internet to 70645.247@compuserve.com. Via telephone, your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s. (Personal messages may be sent to your Gateway editor via packet radio to WA1LOU @ N1DCS or IP address 44.88.0.14.)

The deadline for each installment of Gateway is the tenth day of the month preceding the issue date of QEX.

2298. 300 bps modem for HF use?

Newsgroup: rec.ham-radio
Date: 1990-04-16 01:57:36 UTC
From: dennis@gpu.utcs.utoronto.ca
Message-ID: <1990Apr16.015736.8983@gpu.utcs.utoronto.ca>
Source record: 12203

I have been endowed with a small amount of end-of-budget-year money and would like to use it to buy a modem to decode the FSK transmitted by CHU. CHU transmits this using the (telephone) standard 2225/2025 Hz frequency pair at 300 bps.

I have built several modems to do this in the past from standard 300 bps modem chipsets with good results, but would like to improve on this. Can anyone recommend a commercial 300 bps modem which is explicitly designed for high frequency radio use?

Note that other than effective filters and some control over the carrier detect delay, I'm really looking for something quite stupid. Things like multimode packet controllers and the like probably wouldn't be suitable since I need something which introduces predictable delays. Good quality analog parts followed by very little in the way of digital circuitry would make me very happy.

Thanks,

Dennis Ferguson
University of Toronto

The abbreviation "btw" stands for BY THE WAY, an American colloquialism
and figure of speech. I think in "British" the expression is "By the by."
I have no idea if there is a different equivalent Aussie expression.

>Has anyone petitioned NASA to have the first Amateur repeater on Space
>Station Freedom? I'd love to have my call broadcast for all those
>David E. Tiller davet@tsdiag.ccur.com | Concurrent Computer Corp.

I know this is a sexy idea at first glance, but I'm afraid that if you looked at it more closely you'll find that it's not as nifty as you might think.

First of all, it is almost certain that the US space station will be launched into a low altitude 28.5 degree inclination orbit (that is, if it is ever launched at all.) This orbit (which is also used by the majority of shuttle flights) requires the minimum energy to reach from Cape Canaveral. Given the proposed mass of the station you can bet they'll pick the most economical orbit possible.

Unfortunately, this orbit has very poor coverage of the continental US. Only the southern part of the US will ever see it more than a few degrees above the horizon, and of course passes would be quite short.

There has been a proposal for amateur radio aboard the space station, but it would be for a Phase IV *user* station, not a repeater. In other words, amateur radio would have its own TDRS system. This would give nearly 50% coverage with just a single satellite.

If you want to talk through a repeater in space, there are already plenty up there to choose from, and they are in much better orbits than that proposed for the space station. Oscar 10, Oscar 13 and FO-20 have analog repeaters, and of course there are also the microsats for digital communications.

Phil

According to my Castell's German Dictionary, Litzendraht is "stranded
wire, flex.". "Litze" means "braid,cord,lace,piping;strand (of wire)."

Dave N4DJS

I just *knew* this thing would come in handy again some day :-> .

2303. Multi-Mode TNCs

Newsgroup: rec.ham-radio
Date: 1990-04-16 11:17:00 UTC
From: hfair@PAXRV-NES.NAVY.MIL
Message-ID: <9004170702.AA25736@ucbvax.Berkeley.EDU>
Source record: 12208

Several have sent me messages on this subject. I have tried to respond directly but guess I cannot figure out my E-mail system. Here is what I was trying to send.

I am no expert on multi-mode tnc's, but I can relate what little I know. I have a PK-232 and use it on packet and RTTY. The PK-232 coupled with the Pakratt software is very easy to use on packet and works quite well. Some purists have found problems with the PK-232 on packet, but I have not experienced problems at my level of useage. The PK-232 and software also work well on RTTY (I include Baudot, ASCII, and AMTOR in this category) but actual performance is a bit of compromise. The PK-232 does not use the standard 2125/2295 tone set for 170 Hz shift. It uses instead 2110/2310 for 200 Hz shift. Purists argue that this compromise tone set hurts the PK-232 in weak signal detection, etc., but in most situations performance appears normal. I suspect that in a pile-up a good detector will pick out the true tone set easier that the 200 Hz tone set--meaning that the compromise occurs at both the receiving and transmitting ends. I have seen few cases where I think the PK-232 let me down. There are lots around, they are well-supported, and the software is very good.

The KAM, with which I have no direct experience, appears to be a very nice unit, and a very small unit. The tone sets are true and they look (on a scope) and sound great over the air. I have heard nice comments about the KAM. I have also heard that it takes a while to learn to use it and the related software, but that may have been an isolated opinion. If I were buying a multi-mode tnc today, I would seriously consider the KAM---but I would solicit first hand info from KAM users before going ahead. Seems there are AEA people and there are Kantronics people and they are heavily polarized. Word on the street is that Kantronics really knows their stuff, and they are very helpful if you have to call for assistance.

Hope this helped. 73, Steve , K4FJ.

2304. Morse Coding standards (non-ham question)

Newsgroup: rec.ham-radio
Date: 1990-04-16 14:23:37 UTC
From: tbabst@x102c.harris-atd.com
Message-ID: <3466@trantor.harris-atd.com>
Source record: 12209

I want to know if there are standards for the manual coding of Morse code.
In particular, what are the dot, dash, inter-character and inter-word
lengths.

Sorry if this is a well-known question -- I'm not a ham.
Please E-mail your replies, as this is probably not of general interest.
Thank you.

I'm curious if anyone has tried to insure a repeater. I would have to pull a figure of $5,000.00 out of the hat. The dollars invested doessn't quit make the limit, but the hours, hours, hours are not reflected in bucks. If our box were to receive the wrath of the Gods, I would go simple simon with a rice-box repeater and an 850 controller. 5K would not go far.

>practice 30-45 minutes a night, and have been doing so for the last 2 weeks.
>

I passed! The biggest problem that I had with the test was that it didn't start out with the sending station sending 'CQ CQ CQ ...'. Instead, it started out with the recieving station responding to the CQ and giving his name. My computer program always started out with CQ. Even the Kenwood starts out with CQ! Well, by the time I figured out what was going on I had missed quite a bit. Fortunately they didn't ask for the call signs or I'd be taking the test again.

>
> Ham radio is a heck of a lot more than "Gud luck in the contest"...
>

Far be it from me to deny you your 1st amendment rights but IMHO it can't be a heck of a lot less than the drivel that ARF and its attendees espouse on that net. My boss was at my house and his son wishes to be an amateur. That anti-semitic drivel made an excellent introduction to amateur radio. I beat a hasty retreat to the OSCAR satellite, where I work three satellites in four different modes in 30 minutes. Thank god there is some intelligence in ham radio someplace.

The birds sold the kid in fifteen minutes. DAMN why can't people keep their stupid prejudices to themselves and off ham radio.

Brad Lupton's story about trying to fix a bad potentiometer is all too true; and I'm sure most of us have encountered this problem at least once.

The problem with today's stuff, and especially with the Asian products, is that the things are just simply cheap-cheap-cheap! Few pieces of equipment outside mil-spec stuff can afford the luxury of the old A-B pots that would work virtually forever. I have an expensive color TV from one of Japan's premier TV manufacturers, whose pots (every one!) have become noisy after a just a couple of years. AND SOME OF THEM SELDOM GET MOVED.

The noise and scratchiness is caused by the wearing-away of the carbon deposited on the pot itself. Continuous friction of the sliding contact on the carbon weait away. Cheap pots with thin coatings, poorly-deposited coatings, poorly-prepared coatings, or incorrect slider pressure and design give it up very quickly.

It is unfortunate, but the only remedy for the problem is just to replace the pot. Spraying them with tuner cleaners and solvents more often than not make the problem worse by causing the resistive material to further erode and melt away. Remember, these solvents are made to clean metallic contacts in switches and are pretty potent.

When your pots start giving you problems, they are worn out and need replacing. And be very careful what you spray into your expensive, quality pots.

73,
Dube Todd N5PDK

>I ordered two upgrades on April 2; they arrived on April 11th, UPS
>brown label. Read the instructions *carefully* -- they shipped a
>revised page two with mine.

Yeah, I got a revised page 2 as well. It seems that they found it necessary to tell the installer to be sure and remove the sticky protective shipping plastic from the front of the display. I suppose it would look awfully funny if you didn't. I wonder how many people forgot to :-).

The display kit is very nice, and pretty simple. The whole affair measures about 1.5" by 3" by half an inch thick. Only one flat ribbon cable to solder in place, and it has about 10 conductors on it. The tricky part is that they're about 2mm apart and must be float soldered onto the pads on the circuit board. Getting the old one off was no sweat (of course!). I'm pretty handy with a soldering iron and was able to do it using a 40-watter. A finer tip would'a been nice but a little patience was all it took. Total replacement time cover to cover was about 30 minutes.

The new display is completely readable in open sunlight, even when the operator is wearing sunglasses. There is still a small problem with glare from the shiny glass (plastic) window faceplate, but I'm sure that many rigs must have this problem too. At night, I find it almost too bright and am glad that the panel dim function is available.

I'm really pleased with Kenwood on this affair. They recognized their mistake and they are selling the fix for next to nothing. The replacement display contains the complete LCD panel with controller chips and driver circuitry. As an ordinary replacement part one could imagine that it would cost a lot more.

I've heard that HRO will send your rig off to Kenwood and let them do it all for $50! Given the cost of everything else these days, I consider it a bargain.

BTW, someone mentioned recently that their TS440 had a cheap screw-in SO-239 connector on the back that spun around and shorted out their rig. My brand-new TS-440 has the regular, old-style SO-239 with the square plate and 4 screw holes (only 2 screws in, however :-). I'll stand by Kenwood, since it's evident that they do listen to their customers and they do make reasonable attempts to correct their mistakes. Incidentally, I'm told that the TS-440 is now the best selling HF rig of all.

An incredible weekend of Pirate activity was logged on Los Numeros beginning at 2345 UTC on 4/14 and extending through 0345 UTC on 4/16. Sixteen (!) different Free Air Broadcasters were logged with various snippets of programming, signal strength and antenna heading tests, and plain old ordinary kibbitzing on 7415 kHz.

Logged were the following stations:

WRFI (Radio Free Intelligence) East Coast Pirate Radio
WXZR Radio Gannymead (?)
The Revolutionary Voice of Plainville KBFA
Radio USA Samurai Radio
Voice of Monotony Voice of the Mountains
Rockabilly Radio Radio Outlaw
East Coast Beer Drinker Radio Free Papacia (?)
4th of July Radio WPRA

Programming was relayed across the country to others participating in the Teleconferencing who were unable to 'hear' in the classic sense. What an event!!

Jay_Appell@es.UUCP writes:

>Can anyone suggest sources for a down converter for GOES reception ?

Spectrum International, Inc.
POB 1084
Concord, MA 01742

1691-LY Loop Yagi Antenna, $75
MMG 1691 Preamp, $250
MMK 1691 1691->137.5 MHz downconverter, $330

As you can see, it's expensive. You will also need an AM demodulator;
a PK232 won't work.

>I currently
>intercept the GOES photos from 8080 Norfolk WX and haven't found other
>sources.

Those pictures are originally from GOES TAP, a leased phone line /
commercial satellite service. I'm not sure what the direct GOES
pictures look like, though they are available. I don't know how well
the Loop Yagi works; I've never found anyone who had one and used it
(only a few people who said they had them but hadn't started using
them). The Spectrum International antenna is supposedly hard to build:
it consists just of aluminum pieces that you have to bend into loops and
fasten onto the long "pole" of the antenna at the proper places. The
NOAA bulletins say you need a dish antenna for GOES. I'd be interested
in hearing from anyone who uses the Loop Yagi with GOES.

You might want to try receiving pictures directly from the polar
satellites when they go by overhead; it costs a lot less and requires a
much smaller antenna. You also get much better detail (because the
satellite is so much closer), although without the superimposed maps.

>I would like to receive wirephotos, but I am unable to locate a
>frequency for this that is active. I am located in New England.
>Thanks in advance for your comments.

There used to be an AP station in New England that sent wire photos, but
it seems not to work any more. There used to be a station from Buenos
Aires that sent news photos; the station was for DyN (Diarios y
Noticias) and had a logo that looked like a thumbprint. They were on
11451.00 at 0200Z on 5/7/88, the last time I logged them. I heard what
sounded like a Press Fax station on 5149.41 on this past March 28th
while trying to find TDM stations, but didn't try printing it.

Press Fax frequencies I used to have in my radio:

17673.70 LSB AP, New York
11478.50 USB DyN?
11449.65 USB DyN

If you look through Gilfer's "Confidential" Frequency List, you will find a number of stations marked "AP New York" -- this is how I found the AP stations originally. The pictures tend mostly to be of people kicking soccer balls, and unknown political figures giving speeches. The last time I checked, though, they weren't on. They used to operate on alternate hours during the evening.

>am not too pleased with the results.

One thing to bear in mind: if you are trying to work "up" to a certain speed you may be going at it the wrong way. You need to form a mental mapping between the sounds and the letters being received or sent, independent of any mnemonic device. If you use any sort of mnemonic device to remember the code, or you have to "think" at any time about it, there will be a much lower upper-bound on the fastest speed you can recognise or send. It is like reading; you don't spell out each word individually and figure it out from that, you recognize each word by its pattern. This is why people say "the only way to do it is to practice," because with practice you make this association. But you can learn faster if you start out by consciously avoiding doing anything that will hinder you later.

My personal opinion (yours may differ :-)) is that you should start out learning the code fast. This prevents you from using any mental "crutches" or mnemonic devices and forces you to form the group associations from the start. Otherwise you are likely to (possibly unwittingly) learn memory-aids that won't work above a certain speed.

O.K. Let's look at this problem, then: out here, NEDA has a large network of NET/ROM (actually, TheNet) systems which works moderately well, but even the guys who founded it admit that it's a temporary hack and it SHOULD be replaced by IP. (And these guys are operating on heresay; they're not IPers at this time).

So, at a networking meeting (over pizza, naturally :-)) it came up that the entire network should be converted to IP. The problem is that doing so would alienate probably three-quarters of the users of the network.

Now, it doesn't seem fair to say "tough" to the end-users, and it doesn't seem reasonable to say to them "if you want to use the network, you have to go through an AX.25<->TCPIP gateway (like GRI or RGV)". At the same time, when it comes down to it, I don't think we have the resources out here to build two parallel networks (one TheNet, one IP). (I've tried the NOS stuff to route IP through net/rom, seems rather kludgey to me [no offense, I'm not being critical here, it just seems like a hack of a theoretical idea]).

I'm the FIRST guy to say [CENSORED] 'em if they want to keep their C64's and CP/M Shoeboxes forever ... but now, I'm thinking in terms of my own interests and what will get IP less of a "clique".

ndcvb!cartan!ndmath!nstar!w8grt!jim.grubs@iuvax.cs.indiana.edu (Jim Grubs)
sez:

With guns, most commonly....

> >If you don't see any difference between guns that kill and
> >radios that don't, then you yourself are part of the proof that guns MUST
> >be banned as soon as possible.
>
> "You can take my gun from me when you pry it from my cold, dead
> fingers!"

I rest my case....

Mr. Grubs, you are incorrect (again). The most common way for PEOPLE TO KILL PEOPLE is in an automobile and usually after they have been drinking. Since this forum is not one to discuss drunk driving or gun control, your message and this reply are not necessary to this net, nor are they desired by the majority as can be seen by recent postings asking that they stop. However, about the time it starts to die down a little, UP GOES THE FLAG with another Jim Grubs posting.

It is really hard to avoid an argument when what one says is referred to as "blithering lunacy". And then you go ON to add more fuel to the fire with obviously incorrect statements like the one you just made above.

Can't you just let it go? Please?

Subject: ICOM computer interface protocol (long)
From: carlc@tekgen.TEK.COM (Carl Clawson)
Date: 15 Mar 88 21:51:28 GMT
[Via KA2UGQ]

A recent poster inquired about the computer interface on the newer ICOM rigs. I recently got my hands on the information, and I thought I'd pass it along to the net.

I will be glad to hear about any corrections or additions to this material. I have not extensively tested all of these codes -- my trusty KAYPRO went to lunch on me in the middle of the job -- so there may be some "gotchas" that I haven't yet discovered. I have tested enough of them to be reasonably sure that I know what's going on.

------------------------------ cut here --------------------------------

Computer Control of ICOM Amateur Gear

Carl Clawson, N7KBV

General Description

Several ICOM products feature a built-in computer interface connected to a 1/8" phone jack on the rear panel. However, ICOM gives no information about this interface in the instruction manuals that I've seen. The information exists within ICOM, and my dealer managed to get it for me.

This interface, called the "CI-V" by ICOM, is standard on the following models: 735, 761, 275, 375, 475, and R7000. Earlier models used the CI-IV parallel interface, which can be connected to CI-V by ICOM's UX-14 converter. Models using the CI-IV are the 751, 271, 471, 1271, and R71. The information I got from ICOM was written with the 735 in mind, but a listing of a BASIC program to control the R7000 was appended. I believe it will help with the other models, too. The control codes and data format should be the same for all of them.

The computer interface allows you to do such things as:

- Set and read the frequency and modulation mode

- Set VFO A, VFO B, or memory mode

- Select memory channel

- Store displayed frequency into memory

- Transfer displayed memory-mode frequency to a VFO

Even without a computer, you can run a cable between the remote control jacks of two rigs, and whenever the frequency or modulation mode of either is changed, the other will track it if possible. (If the rigs have incompatible frequency coverages, like the 735 and R7000, funny things can happen.)

The interface is bi-directional, using TTL levels on a single line for sending and receiving serial ASCII data. You may need an appropriate hardware interface to convert, for example, RS232 to TTL. (I understand that Commodore computers have TTL inputs and outputs so that no interface is needed with them.) I used the Motorola MC1488 and MC1489 chips powered by two 9-volt batteries to interface to my RS232 line. Appendix 1 lists the pinouts used for this interface. If you'd rather buy something, ICOM sells the

model CT-17 level converter for RS232.

The interface uses a "carrier-sense, multiple-access with collision detection" local area network protocol, so that multiple rigs can be connected in parallel without difficulty. Thus, you can use the same RS232 line and level-converter interface to control many rigs. Each rig must have a unique address, which is set by internal jumpers. Each model comes factory preset to its own address, which is 04 for the 735 and 08 for the R7000. Appendix 2 has information on the jumper settings.

I will use the words "receive" and "send" to refer to data transmission. Thus a "receiver" isn't necessarily an R7000; it's any device receiving data from the CI-V bus. I will use the word "rig" to mean an ICOM product using the CI-V interface.

Data Format

The rigs send and receive data in variable length packets, which are formatted as follows:

Byte # Contents

1 hex 'FE' (i.e. 11111110 binary, 254 decimal)
2 hex 'FE'
3 <RX>

4 <TX>
5 <Code>
6-n <BCD data of variable length>
n+1 hex 'FD'

The two hexadecimal FE bytes signal the beginning of a packet, and the FD byte signals the end. <Code> is the control code sent by the computer to the rig, which determines the action that the rig will take. In some cases, the receiving rig will include a control code in its response to the sender; see the section "Control Codes and Responses" below. <TX> is the address of the device sending the data, and <RX> is the address to which the data is being sent. When a rig responds to a data packet, it addresses that response to the <TX> in the packet. Thus, if your computer requests a rig to report its frequency, it will address that report to the computer and other rigs will ignore the data. (Of course, the computer can lie about its address and trick one rig into talking to another!) Your computer should use its own unique, non-zero address on the network. I will assume in the examples that the computer is at address 02. There are two control codes that can cause any rig on the network to respond when sent with <RX>=0; I discuss these

below.

Bytes #6 through #n contain any data required by the control code, in BCD format with 2 decimal digits per byte. Frequency data is sent starting with the byte containing the 1-Hz and 10-Hz digits. These digits are sent even if they are not used by the rig, so that the data format is the same for all rigs regardless of their frequency coverage and resolution. For example, consider the frequency 25.13244 MHz. This is broken up into two-digit groups:

25 13 24 40

It is then coded in BCD. In other words, consider each digit group to be a hexadecimal number instead of decimal. The decimal values of these BCD digit groups are 2x16+5=37, 1x16+3=19, 2x16+4=36, and 4x16+0=64. Now send these groups, starting with the least significant. The complete data packet will be, in hexadecimal,

FE FE <RX> <TX> <Code> 40 24 13 25 FD

If you have more than one rig on the network you may occasionally receive a sequence of 5 bytes of hex 'FC'. This is the "jammer code" used by a rig to indicate that a collision has occurred. Each rig, when sending, monitors the interface. If it does not receive exactly what it sent,

then a collision occurred, i.e., another rig was sending data at the same time. If a rig detects a collision when sending a packet, it will wait until the network is idle, then send the jammer code. A rig that receives this code will realize that a collision has occurred and ignore the previously received packet. Because the ICOM remote control ports are bi-directional, your computer will receive everything it sends, so you can check for collisions from your computer, too.

Control Codes and Responses

Most of the following codes are addressed to a specific rig, which addresses an acknowledgement packet to the <TX> contained in the control packet. The first two codes, 00 and 01, can be sent to the "group call address" of 00, in which case any rig will receive them without sending an acknowledgement. These two codes are sent in this way by any rig when its mode or frequency is changed by manual control, and are received by any rig on the network. This allows a number of rigs to track each other in frequency and mode without computer intervention. Rigs can be inhibited from sending and receiving group call packets by an internal

jumper. See Appendix 2 for more details. These codes can also be sent with a specific, non-zero <RX>, in which case they will be received by the addressed rig even if the group call function is disabled.

00 Set frequency. See above for format of frequency data. See code 05 below for more details.

01 Set modulation mode. One or two data bytes are required to indicate the mode desired.

Data Mode

00 LSB
01 USB
02 AM
03 CW
04 RTTY
05 FM
05 00 SSB (R7000)

02 Report tuning range. No data required. The rig will report its frequency limits in the format

FE FE <RX> <TX> 02 <upper limit> 2D <lower limit> FD

(Hex 2D is the ASCII hyphen.) According to ICOM, some rigs report the lower limit first.

03 Report frequency. No data required. The addressed rig returns its displayed frequency to the sender in the format

FE FE <RX> <TX> 03 <Frequency> FD

04 Report modulation mode. No data required. The addressed rig returns its mode to the sender using the codes listed above. Rigs with selectable bandwidth return an additional byte indicating the bandwidth. The format of the response is

FE FE <RX> <TX> 04 <Mode> <Bandwidth> FD

The bandwidth codes are:

Data Bandwidth

01 Width 1 (widest)
02 Width 2 (narrower)
03 Width 3 (narrowest)

05 Set frequency. The data format is given above. If the data contains fewer digits than the rig uses, the digits sent will be changed and the rest will remain the same. If the rig receives valid frequency data within its tuning range, it responds with a packet containing the data "FB":

FE FE <RX> <TX> FB FD

If it didn't like the data, it responds with the data "FA":

FE FE <RX> <TX> FA FD

These acknowledgement codes are used by all following commands.

The 735 responds to out-of-range frequency data by sending the "FA" acknowledgement and: 1) If the frequency it receives is less than 0.1 MHz, it sets its frequency to 0.1 MHz, 2) If it received 4 bytes of frequency data that is more than 30 MHz, it sets itself to 30 MHz, and 3) If it received more than 4 bytes of frequency data, the data is ignored.

06 Set modulation mode. If one byte is sent, it sets the mode per the above table. If two bytes are sent, the second is the IF bandwidth.

07 Set VFO status. If no data is sent, the rig changes from MEMORY mode to VFO mode. If data 00 or 01 is sent, the rig sets VFO A or VFO B respectively.

08 Set memory channel. If no data is sent, the rig changes from VFO mode to MEMORY mode. If BCD channel data is sent, the rig changes to that memory channel.

09 Store displayed frequency and mode into displayed memory channel. No data required.

0A Write frequency and mode from displayed memory channel to a VFO. No data required.

Examples

I will give a few examples of codes and responses for the 735. The 735 is at address 04 and the computer is at 02. First, let's find out what's in memory channel 1 (code 08 to set the channel, and code 03 to read the frequency). Assume the 735 has the frequency 7.12750 MHz stored in memory #1.

- 6 -

Computer to 735:

FE FE 04 02 08 01 FD

735 to computer:

FE FE 02 04 FB FD

Computer to 735:

FE FE 04 02 03 FD

735 to computer:

FE FE 02 04 03 00 75 12 07 FD

Now let's change the frequency and mode to 14.02500 MHz USB (codes 05 and 06).

Computer to 735:

FE FE 04 02 05 00 50 02 14 FD

735 to computer:

FE FE 02 04 FB FD

Computer to 735:

FE FE 04 02 06 01 FD

735 to computer:

FE FE 02 04 FB FD

Now store the changed result back into memory #1. This channel is already displayed, so we need only the store com-

mand, code 09.

Computer to 735:

FE FE 04 02 09 FD

735 to computer:

FE FE 02 04 FB FD

- 7 -

Appendix 1 -- RS232 to TTL converter

This is an easily built converter that will run your ICOM gear from a standard RS232 line. It can be built in an hour or two for about $10. The converter uses two inexpensive, widely-available chips -- the Motorola MC1488 line driver and MC1489 line receiver. The only other components needed are a box, connectors, a power switch, and a couple .01 or .1 capacitors to bypass the power supply leads. I used two 9V batteries for power. Power for the 1488 can be +-9 to +-15 volts, and the 1489 requires +5 to +10 volts. With a suitable DC-DC converter chip and a 78L05 or 78L08, you could power the circuit off of your 13.8-V supply. Or, if you're clever, figure out a way to trickle charge two 9V nicads off of your RS232 line.

The pinouts are as follows:

For the 1488 -

Pin Connect to

1 -V
2 ICOM remote jack center conductor
3 RS232 pin 3 (RD)
7 Ground
14 +V

For the 1489 -

Pin Connect to

1 RS232 pin 2 (TD)
3 ICOM remote jack center conductor
7 Ground
14 +V

Ground pin 7 of the RS232 line and the outer conductor of the ICOM remote jack, and you're on line.

- 8 -

Appendix 2 -- Jumper Selections

There are jumpers in the ICOM rigs to set the device address, baud rate, and to enable the group call feature. You must look on the schematic to find them. The jumper to enable the group call feature is called the "transceive" bit by ICOM, and may be labeled with "TRV" on the schematic. The others are labeled "DBn" on the 735 and R7000; look for something similar. The rigs are factory-set to 1200 baud, transceive enabled.

I have specific information from ICOM on the 735 jumpers, and for the R7000 I have a likely guess based on the 735 codes and the schematic.

For the 735 -

The jumpers use lines labeled DB0 through DB5 at connector J22 on the PL board. Lines DB0 through DB2 set the device address. Line DB3 is the transceive enable. The baud rate is controlled by DB4 and DB5 according to

DB4 DB5 Baud

0 0 undefined
1 0 9600
0 1 1200
1 1 300

The 735 is set at the factory to address 04.

For the R7000 -

The jumpers use lines DB0 through DB7 at connector J17 on the logic board. The address is set by DB0 through DB4, DB5 is the transceive enable, and the baud rate is set by DB6 and DB7. The factory address is 08.

If you have any other rig, you can determine its address by hooking it up to your computer and changing the frequency or modulation mode manually. You will receive a group call packet that contains as its 4th byte the address of the rig.

Subject: TS440S Interface Information
[Via KA2UGQ]

A recent posting asked about the TS400 Interface.

I just came across the following which describes how to build
one yourself and save big $$. I do not know the source of
the article.

Mark C. DiVecchio 10435 Mountain Glen Terrace, San Diego, CA 92131
K3FWT Home of PC-VT and LPTx 619-549-4056
sdcsvax!man!wolf!markd Bulletin Board 619-549-3927

Kenwood Computer Interface Instructions

These Instructions are TS-440 specific, but the basics also apply
to the TS-940, TS-811 and TS-711.

It is possible to save yourself a few dollars and lose nothing in
quality by buying the parts to upgrade your Kenwood radio for computer
control. Just purchase the parts were you find them and install them
using the instructions in the Radio's Manual.

IC 54 is a uPD-8251-AC Serial Communications Interface.
Commonly called an 8251A ($1.89 Mail Order)
IC 55 is a TC-4040-BP 12 Stage CMOS Divider.
Commonly called a 4040 ($0.69 Mail Order)

The IC-10 Interface Kit from Kenwood Contains ONLY these two parts
and less instructions than are in this file. The only thing you are
going to miss, is the $22+ price tag on the IC-10 Kit.

Signals are TTL levels (NOT RS-232)
Baud rate is 4800 (1200 Opt.)
Format is ASCII Serial; 1 Start, 8 Data, 2 Stops

The Baud rate may be changed to 1200 Baud by removing jumper W50 and
installing a jumper from the left pad to the center pad as viewed from
the front of the radio. This will become obvious once you have the
radio opened up. Many other Baud rates are possible, just look at the
schematic.

As long as you are in the radio, lift D-60 to enable the 10 Hz.
display. The main tuning knob is varing this digit, so you might as
well see it. It also helps when using RIT/XIT as the RIT/XIT display

does not resolve the 0.01 KHz. digit. This Modification is in the Radio's Book.

Not in the book is the fact that if you lift D-80 and do an MPU reset, you will be able to transmit on any frequency between 1.5 and 30.0 MHz. This means you will be able to work the Mars nets, Etc. Do not transmit out of band. It is illegal even if it is accidental.

Some computers use TTL levels on their serial ports. If so, here is a time when you will not have to convert it to RS-232.

The IF-232 Interface from Kenwood is a 1488 and a 1489 chip in a box. These are an RS-232 Quad Line Driver and Receiver and are available at Radio Shack for $1.29 Each. Here is an easy project that will save you a lot over the $69+ Kenwood price of the IF-232 Interface. The 1488 needs a + and - supply. Unregulated + and - 12vdc is just fine. Get the +5 vdc for the 1489 by putting a 7805 regulator on the +12 vdc supply. 100 ma. is about the max you'll draw, so the smallest transformer you can find will still be plenty large. Don't forget to series up two of each gate to cancel the inversion that the 1480's produce.

ACC-1 Connector Use a 6 Pin DIN Connector.
(Radio Shack $1.29)
Pin Signal Comments

---

1 Gnd Signal Ground
2 TXD Serial Data from Radio to Computer
3 RXD Serial Data from Computer to Radio
4 CTS Computer Ready; (Radio Input)
5 RTS Radio Ready; (Radio Output)
6 No Connection

Pins 4 and 5 may be left Unconnected.

Subject: CAT Interface for Yaesu 727
Path: ..!JUNE.CS.WASHINGTON.EDU!bcn (Clifford Neuman @ The ARPA Internet)
[Via KA2UGQ]

I have seen many requests for information on this over the past year
or so. At one of our local hamfests, Yaesu had a 1 sheet handout on
how to use CAT on the 727. That handout follows. I have not tried
this myself (yet). Note that the levels are not standard RS-232, but
should be fairly easily converted.

The following information is from Yaesu. There are some errors picked
up by KB7ABA which are noted in the approriate place. I have not yet
tried using this. de N1DMM.

FT-727R CAT System Interfacing and Control

This information describes the hardware and software requirements of
the CAT (Computer Aided Tranceiver) System in the FT-727R.

Connections

Four connections are used by the CAT SystemL three at the CAT jack,
illustrated below, and one (Signal Ground) ar the outer contact of the
MIC or EAR jack.

DO NOT SHORT THE OUTER CONTACT OF THE CAT JACK TO GROUND!!!

[Diagram of the CAT plug:

Looks like a stereo audio jack of the appropriate size.

The outer sleeve is +6 to +12 V DC (Battery Voltage) I do not think
this line needs to be connected.

The middle contact is the Serial KeyCode Input.

The center contact is the Serial Meter Output (00h to 0Fh).

See the manual for further description.]

Data Format:

All serial data consists of single byte binary codes sent at 4800
baud, TTL levels, with two INVERTED stop bits and one INVERTED start
bit.

Key Codes:

CAT Control consists of duplication the keystrokes that can be made on
the tranceiver keypad by sending the corresponding keycodes to the
Serial Keycode Input contact of the CAT jack. The most significant
four bits (MSD) correspond with the key column and the least
significant four bits (LSD) correspond with the key row. The Function
key (on the side of the tranceiver) is simulated by setting bit 7.
Results are identical to those described for manual operation in the
FT-727R Operating Manual. Serial Meter Output is sent approximately
every 100 ms while receiving.

[Table for the codes. The lines in [] are the original values in the
Yaesu handout, and are followed by the corrected lines as determined
by KB7ABA. Remove the lines in [] to see what sould be the right table.]

2327. Re: V31BB QSL INFO

Newsgroup: rec.ham-radio
Date: 1990-04-17 12:41:28 UTC
From: waco@cbnewse.ATT.COM
Message-ID: <14268@cbnewse.ATT.COM>
Source record: 12338

This past weekend I worked V31UK who had come over from the mainland to Jim's QTH and was operating from V31BB's station. I listened to several of his QSOs and he discussed his own QSL habits and problems. He also talked about Jim's QSLing. He claims Jim has difficulty in keeping up with his QSLing. Apparently V31BB is very active and, judging from David's discussions, does QSL, albeit slowly.

I cannot speak for V31BB and my opinion on his operating practices (low) has not changed. However, it appears that his intention to QSL is to do so.

Having been involved in chasing DX for a number of years, I have learned not to become too anxious for QSL cards to appear in my mailbox. I sometimes wait months before sending out cards and have found that some expected cards never arrive, but many arrive months or even years after a contact. It is not uncommon not to receive a QSL from a station. It is frustrating when you need a country confirmed. However, when looking back through my log, there are many unconfirmed contacts that, at the time of the contact, seemed like a sure thing. Usually, the only sure thing for receiving a QSL is from a bona fide DXpedition or a contact with a Soviet ham, with the exception of the only Albanian contact I have had.

Belize is not a "rare one" and if you really need it, just keep tuning the dial; it will show up (if this is true, why do I still need Albania and Kaliningrad?, hi, hi). You don't need to work V31BB to get a contact.

ANNOUNCING THE 1990
MASSACHUSETTS QSO PARTY

DATE/TIME: 0000Z 5 May 90 to 2400Z 6 May 90

OBJECTIVE: Work as many hams in as many
Massachusetts counties as possible
during the 48 hour period.

MODES: CW, and Phone (No cross-mode, repeater
or packet contacts)

BANDS: All amateur frequencies from 160 meters
through 10 meters.

SUGGESTED CW: 15 kHz up from the bottom of the
FREQUENCIES: General class subbands (eg., 7040,
14040, etc.)
SSB: 25 kHz up from the bottom of the
General class phone bands (eg. 3875,
7250, 14250, etc.
ALSO: Novice & Technician subbands:
80/40/15/10 meter CW
and 10 Meter Phone (28.315)

EXCHANGE: RS(T) and:
Massachusetts Stations: County
All others: State, Province,
or Country (DX)

OTHER: Work stations once per band and mode. MA
to MA contacts are allowed. Portable or
mobile MA stations may be worked again if
they change counties.

SCORING: 1 Point per phone contact
2 Points per CW contact
5 points if you work club station W1TKZ

Multiply to points by the multiplier

Multiplier for MA stations= total number
of states, provinces, DX countries and
MA counties.

Multiplier for non-MA stations= number
of MA counties (max = 14)

SUBMISSION: Logs to WARS by 06 Jun 90.

SPONSOR: Wellesley Amateur Radio Society
MA QSO Party

To all you people who do not want guns: Isn't it interesting that one of the first things Mr. Gorbachev did when Lithuania seceeded was to confiscate all of the weapons from the Lithuanian citizenry. Maybe he did not want them able to withstand the red army....

The lesson that I take from this is that an armed citizenry keeps a tyrant at bay through the fear of an armed uprising.

Yes, I too am appalled at the violence in our cities (especially Boston lately), but the responsible use of guns is a very strong deterrant to tyranny as well.

I am not in the NRA. I do not have a gun, and probably never will in my own home. But I am sympathetic with what they are saying....

Where there is a will, there is a way....

>* is it compatible with any mode of existing "regular" slow scan TV/ham
> equipment?
>
> ....

>John Kirby

I have not tried a Visitel on the radio but I have serious doubts
that it could ever work. The details of the transmission format are
a little fuzzy in my brain but here is what I recall.

The image starts with a digital header containing synchronization
& calibration signals and information about the image size. After
this there is NO horizontal sync as in most ham SSTV formats.

The picture is composed of 96 x 96 pixels of 32 gray levels.
The pixel rate and audio carrier frequency are both 3579545/2048
per second. Gray levels are conveyed by a combination of phase and
amplitude modulation. 2 phases (180 degrees apart) and 16 amplitudes.
Each pixel is one audio cycle. Black and white are both full
amplitude and opposite phase. Gray levels are lower amplitude with
medium gray being the lowest amplitude.

This is fine for a phone line or FM radio. Let's perform a thought
experiment about what would happen on SSB ...

Suppose your tuning was off by 20 Hz. The receiving end expects one
pixel per audio cycle and would gather the pixels at 1727 or 1767 per
second while the sender is producing them at 1747 per second, producing
a badly slanted picture. The phasing of one pixel per audio cycle
would be all messed up. QSB of propagation and AGC of the receiver
would also corrupt the amplitude modulation of the audio carrier.

Several people have proposed using the Visitel for HF SSTV but I have
never heard of any success. I would be very interested in hearing
more about people's experiences with it.

If you would like to try SSTV at a low cost use your home computer.

* AEA has an interface for the Amiga for about $300. I've never
seen this in operation but it sounds very impressive from
everything written about it.

* SPEC-COM has SSTV software for the Radio Shack COCO. I think it
was about $40. This might be related to the article in
the November & December 1984 issues of 73 Magazine.

* A color SSTV program for the Atari ST is available from several
user groups. It requires a simple interface that can be built for
about $7. See 73 Magazine, December 1989 and January 1990.

Even if you're not interested in the Atari ST, you should get
a copy of this article. It contains a brief tutorial on how
color pictures are transmitted and pointers to other sources
of information on ham TV.

* I have a vague recollection of a product for the IBM PC from a
company named something like Computer Systems Consulting.
But it was only black & white. You don't see too many
B&W pictures anymore.

* See QST, August 1985, for information on SSTV for the old 8 bit
Atari computers.

* There are probably others which weren't well publicized.

In summary,
- The Visitel is not compatible with any of the ham SSTV modes.
- The Visitel modulation scheme can't be decoded by the usual
Frequency to Voltage demodulators.
- I seriously doubt the Visitel would work over an SSB radio
because it was designed for a communication medium with
much different properties.
(Please, someone - prove that I'm wrong!)

Color SSTV can be very expensive but it doesn't have to be anymore.
If you must have 262,144 colors, spend $1295 on a Robot 1200C. If you
want to make only a small investment to try something new and interesting,
use one of the systems based on a home computer.

Has anyone tried out the new AOR AR-1000 portable scanner?

This a 1000 channel handheld that covers all the standard PSB
frequencies as well the 800 Mhz band. It has 40 chan/sec scan
capability. It was advertised in the RSGB "Radio Communications"
magazine under both the AOR designation and private labeled
under the "Nevada" name.

2332. Need info on Kenwood Rmt Control!

Newsgroup: rec.ham-radio
Date: 1990-04-17 16:35:57 UTC
From: billp@billp.UUCP
Message-ID: <800@billp.UUCP>
Source record: 12339

I am building a controller for my club's Repeater/Remote-Base. I know, hams aren't suppose to be into building things anymore... What we don't want to build are the remote controlled radios. We've looked at the ICOM 900 series radios and the Kenwood radios. The Kenwood radios interface through the mic connector on one or two leads, the ICOM is a stack of pins!

The problem is that Kenwood is being real tight lipped about the protocols used between there control heads and the radios. I even offered to sign a non-disclosure agreement. They just aren't interested.

Before I spend the money on a control head I'll never use and weeks of time spoofing the protocol myself, I'd like to find out if there is someone out there in Usenet land that's already done it and is willing to share.

Any help or pointers would be greatly appreciated.

2333. Re: TCP/IP in anticomputers

Newsgroup: rec.ham-radio
Date: 1990-04-17 16:43:09 UTC
From: brian@ucsd.Edu
Message-ID: <13137@ucsd.Edu>
Source record: 12335

Locating 'telnet' in the TNC isn't the right approach. I see no reason why your local tcp/ip network node can't support a telnet server for AX.25 connections. With such, joe-dumb-terminal-ham would connect to the node, as he does now with net/rom, and request a connection to a distant node, as he does now with net/rom, and get a nice reliable high-speed network connection to the other end, as he occasionally does now with net/rom. He can even do uploads and downloads, using whatever error-full protocol he currently uses, since telnet can be completely transparent if desired. In other words, for him, there's no difference!

But the tcp/ip network will let the advanced packet operator/researcher do much much much more, since such a person can generate the IP packet for whatever he is doing (telnet, ftp, smtp, snmp, digital voice, weber pictures, etc. etc.) in his shack computer and send it into the network through the very same network node.

Thus this kind of configuration is a complete win for all concerned. I think the improved performance of the resulting network will sell many people on upgrading from dumb-terminal status to sophisticated ham computer user - which they can't do with the existing net/rom network.

There will, of course, always be many who don't upgrade - those who seem to think that the box they bought is good enough, or else it wouldn't be sold. They're the same people who refuse to install an $11 mod that would incredibly improve their TNC's performance. If they can use the network, they're happy.

For the average user of a ham network, whether it runs tcp/ip or net/rom (or even ROSE, ecch) isn't important. For the advanced user, tcp/ip offers the most flexible networking environment currently available.
- Brian

> I have a TS930s with antennae tuner. Lately, as I am sending cw I have noticed that the ALC starts to drift lower so I turn up the carrier and it keeps drifting down until I lose that ALC. Can anyone give me any suggestions as what to look for or do? PS: I have never had to turn the carrier up to maximum. Sooner or later I fid a point usually a little over half way where the length of the QSO is less than the drift. Also, if I do not key the transceiver for a while the ALC is up to high and I have to tur

n
>

You didn't mention how old your 930 is, but I suspect it's probably got a serial number something like 32xxxxx or lower (the first two numbers are the important ones here). Anyway, there was a problem with the early 930's with ALC drift, caused by flexure of the PA printed circuit board. Sounds weird, but true. As the PA board heats up with long transmissions, particularly on CW, the board flexes and the rivets which are used on the board to provide ground feedthroughs from one side to the other don't always make real good contact with both sides of the board. When the board cools down, it flattens out and the problem goes away, until the next time you transmit. Under certain conditions of hot board and high RF currents on the board grounds, it may not be possible to get full power out of the PA.

The fix is: CAREFULLY remove the PA assembly from the radio (not fun), and EVEN MORE CAREFULLY remove the PA board from its heatsink. Be sure to observe that under certain of the transistors which are bolted to the 'sink are some insulating pads- very important to get them back in the right places, or ZAP! when you turn it on. With the board in your hand, observe that there are a number of locations (maybe as many as 20- I don't precisely remember, last time I fixed one was in '84) where there are small rivets going through the board to tie the grounds together. Some of these places include the areas around the Emitters of the Final Transistors (the MRF422's) and around the Emitters of the Drivers. Solder each of these points, making sure that the solder REALLY FLOWS at each joint of a rivet and the board. Don't be afraid to get the board good and hot- you want all that green coating around the joint to fall off so you can get a good solder connection. Make sure you do this at all such areas, also reheat any suspicious-looking joints around the rest of the PA board. After you do this, you can put it back together- use heatsink grease under each device, including the Finals. Screw the devices securely back down to the heatsink, and re-install the assembly in the radio. This should have cured the ALC drift problem.

WARNING: If you are not comfortable with this work, DON'T ATTEMPT IT! You can, if not careful and somewhat skillful, really F**K up the radio! Also, Kenwood Service has a Service Bulletin on this problem, which may provide more detail on the locations of the feedthroughs and other important stuff I may have forgotten. I'd suggest contacting them at least for the bulletin and maybe for a quote on them doing the job- they may have a flat charge for this, the added benefit being they will also do the other standard service updates to the unit for no additional charge (there are a lot of things that got updated in the early 930's).

I used to be Sales/Service Manager for Texas Towers and did a lot of out of warranty work on Kenwood Equipment, that's how I know about this fix- also, I had one of the first 930's in the States, in addition to the one I currently own (bought well after they had fixed all the early production problems).

Hope this has helped. Dave KD5RO/2

Let me risk being labeled a heretic and play devil's advocate for a moment.
What I see implied above is a bit of "Let's fix something that's not broke".
When one transitions from experimenter (The tcp/ip community) to service
provider (BBS, node, digi owner - anyone who grabs a chunk of a public
resource and offers a service to the community.), he should pay particular
attention to the user community and their needs (Brian Kantor will debate
this point but nontheless :-).

Let's look at some realities. The first is that in general, 1200 bps
L/WANs are going to de de rigeur for quite some time to come. Sure
we mentally and verbally masterbate about faster modems but the
combination of many factors, not the least of which is all the commercial
vendors racing headlong toward proprietary protocols, conspire to make
1200 baud, in some few cases, 2400, the lowest common denominator.

Given that reality, one must admit to the next one - IP at 1200 baud sucks.
Especially in a properly engineered RF environment (full duplex, no
digipeaters) ordinary AX.25 beats the pants off of IP for what most
users use packet for - mainly keyboard chatting and BBS browsing. It is
neither our duty nor our right to tell a user that his particular form of
packet enjoyment, say, keyboarding, is improper. Our duty as service
providers is to provide the facilities our users want and introduce new
technology wherever and whenever it is appropriate. A TheNet network
talking to chat hubs such as Packet Cluster or the like provides just
what most ham users want.

Even for file transfers, I've found it faster to take a binary and
uuencode it, put it on my BBS as a message and let it forward to
my recipient than to attempt an FTP of the same file. And remember
that this is on a properly engineered RF network.

In terms of an average non-computer-professional user, the combination of
poor performance, buggy code, "Read the f*cking source code" for

documentation, a poor user interface and a generally elitist attitude among some of the experienced users and implementors pretty much eliminates IP from consideration. (We all know that these problems are not unique to Phil's package but it is the point of discussion at the moment.)

It is sometimes hard for us bleary-eyed hackers that many hams have no interest in the gee-whiz aspect of packet and simply want to use it as a tool to facilitate other aspects of the hobby. This is most emphatically NOT the "appliance operator" syndrome. The DX packet cluster network here in Georgia is an example. This is a network of "chat hubs" that link to each other and provide a large roundtable environment as well as messaging and several other features of particular interest to DX ops. The network is implemented with a commercial package written by someone at DEC (and yes, it is just as buggy as the PD stuff but you have to pay money for it and you don't get source.) It comes with nice user docs and can be configured by a non-hacker. This network was built independently of the state packet group, GRAPES, mainly I think, because the DXers felt that we are too experimentally oriented for their needs.

Your typical user on this network is a serious DX operator. He has bought a computer, TNC and radio and dedicated it to cluster operation. He nails up a link to the nearest hub and leaves it there more or less forever. That's as far as his interest goes. He'd never know the difference between an MTU and AXHANG much less care. In short, he is a USER. I'm personally quite gratified to see this purely end-user application develop even if it did happen outside of the normal channels.

I've strayed quite a bit from your immediate question and I know I've gored quite a few sacred oxes (let the bellowing begin!). The theme is simply, find out what your users want and then try to provide them with that service. I've found that users are usually at least aware of some aspects of the state of the art and will accept the change necessary to enjoy new stuff just as soon as there is some likelyhood that more time can be spent using as opposed to debugging the technology.

We have the same situation as in the commercial world. There is a place for basic research (IP, 56kbps, ethernet-over-{microwave,laser,carrier pigeon}, and the like). Then there is applied development where the product of basic research is "productized" and delivered to the user body (consumer). Both are essential, equally important and almost never mix well together. It is important to realize the distinction and then to realize what it is you are providing. If you are nailing up digis, nodes, bbs's, servers and the like, you are a service provider. If on the other hand, you put up an experimental network using gnats as carriers and tell everyone that they are welcome to participate whenever and however the system works, you engaged in research.

So find out what your users want and proceed accordingly.

2342. Spelling flame

Newsgroup: rec.ham-radio
Date: 1990-04-18 05:38:26 UTC
From: brian@ucsd.Edu
Message-ID: <13156@ucsd.Edu>
Source record: 12340

Yes, I know one is not supposed to issue spelling flames. However....

Let me briefly point out that an article containing misspelled words and poor grammar has much less impact than one that does not.

This is because, to the reader who notices the flaws, the article with poor grammar or misspelled words reflects a lack of orderly thought on the part of the poster. Thus the reader naturally questions the validity of the poster's ideas and information: "If he can't spell it or turn out an understandable sentence, why should I believe whatever it is he's trying to say?"

And that brings up another point: sometimes the text is so garbled as to obscure or completely mask the poster's meaning. You and I have seen articles on here that were completely undecipherable because the poster's thoughts were completely obscured behind his inability to express them.

Allowance, of course, must be made for those for whom English is not their native language. But those articles are rarely a problem since the posters of those articles usually take extra care to ensure the understandability of what they've said. What is so saddening is that there seem to be people posting here who are computer-literate but otherwise barely able to write their native language.

So please, to ensure that your postings have the greatest possible value to the readers of this group, take just a moment to check for typographical errors, to look up the spelling of words you aren't sure of, and most of all, to read what you have said over just one more time to make sure that it really says what you want it to say.

We will all thank you.
- Brian

2343. 10m propagation

Newsgroup: rec.ham-radio

I got my novice and tech licences a couple weeks ago and have been enjoying myself greatly on the 10m HF band. I've had some real surprises in the past couple days while operating at the ham radio club station (W6YX).

I've been aiming the beam antenna out over the Pacific Ocean to try making contacts overseas in that direction. Several times, I've been aimed toward Hawaii or Japan and called CQ, and had a ham in Alabama, Mississippi, Tennessee, etc answer it. After I lock it in, I'll rotate the antenna around to face that way. If they're talking while I rotate it, I'll notice I have, typically a 5 by 0 signal from them, then as it rotates north it fades and gets noisy, then as it swings toward them, the signal jumps up to a 5 by 8. That's happened a number of times. Also I once was aimed at Hawaii calling CQ and someone in the United Kingdom answered, but I wasn't able to lock him in. Again behind my antenna.

After I've been back for a while and thought about it, it sounds like I was transmitting out west and the signal was going around the planet and reaching someone to the east, and vice versa when I received! This is really strange as I never thought long path propagation would be possible on 10 meters since it is a daytime band, and to do long path the signal has to cross all the way across the dark side of the earth. But it seems to have been happening. Has anyone else noticed this on 10m?

Oh, I also made my first overseas contacts today. ZK2KY in Niue, an island in the South Pacific, and VK2CX in Nelson Bay, Australia. Looking forward to more fun!

Source record: 12346

Why is it necessary to have repeaters with so much power?

I can see it if it is a repeater with a wide area of remote receivers.

But if it is a repeater with a common antenna for transmit and receive,
then 250 watt transmit will make it heard wider than it can be hit from
the average 25 to 50 watt mobile station.

Sorry, but what is probably happening is your beam ant. is not truly
uni-directional. Some of the directors will be acting as reflectors and vice
versa.

I don't know what the problem is with Kenwood USA. I was in need of the same
information awhile back and got the same response from the USA office. After
searching around and asking many people I finally came across a fellow in Ga.
that was able to get the information faxed to him from Japan. They were more
than happy to give it to him. They sent the information the next day no less.
I was able to get a copy from him but have not been able to implement it yet.

I would suggest contacting Kenwood Japan.

I too have had some ideas on using to remote support offered via the mic connector, but at high price for the RC-10 controller, this project has languished. I would like to interface a separate UHF receiver/transmitter to my TM-321 (220Mhz.) so as to operate cross-band (like the new crop of dual-banders) in full duplex. All this to be done out of the car to enhance my fringe area coverage via my UHF walkie.

So if you have any info, please pass it along, Email or Usenet.

I would say that in 250 watts may get you 100 to the base of the antenna after losses from duplexer, long feed line, and having less than the rated output. 250 maybe when operating at full input power and using 13.8 volts. Our system users a 120 watt Mirage repeater amp, running 73 watts output to the duplexer, 55 watts out of the duplexer through 50 feet of 1/2" hardline. Our receiver is .18 microvolts for 12 Db Sinad, .24 through the duplexer. This combination is fairly balanced when using a 25-30 watt mobile transceiver with a 3 DB gain antenna. But when using a portable, we tend to get into the repeater receiver better than hearing it. Due to ignition pulse noise, man-made noise, rubber antennas and inside car operation, we could benefit from more power to fill in the marginal areas. We do have one satellite receiver and one remote receiver to help the portables along.

If you have a clear repeater channel (a seldom enjoyed luxuary in Sandy Eggo now adays) then the more power the better. Same in mobile operation. I seldom run "low power" in the car (unless operating Simplex) as I want a full quieting signal into the repeater as much as possible. It's inconsiderate and irritating to repeat white noise for all other listeners to hear.

Barry and I know each other quite well and I think his obvious (to me) tongue in cheek was missed. The computer used was a Cray-2. It has 256 megawords of 64 bit memory and four processors running in parallel. The Cray Research Corp has done a good job of achieving reasonable parallel performance with little in the way of hardware support for it. The Cray was used as a software demodulator running the `optimal' FSK demod. This is

bandpass filter, hard limiter, bandpass filter, discriminator of your favorite variety. I chose filter/slicer (its simple). I chose not to do the clock recovery on the Cray and let the Crayette (KA9Q's little grey cells) do the clock recovery and NRZI decoding.

> equipment?
>
> ....

>John Kirby

=====

Follow-up....

I have not tried a Visitel on the radio but I have serious doubts
that it could ever work. The details of the transmission format are
a little fuzzy in my brain but here is what I recall.

The image starts with a digital header containing synchronization
signals and information about the image size. After this there is NO
horizontal sync as in most ham SSTV formats.

The picture is composed of 96 x 96 pixels of 32 gray levels.
The pixel rate and audio carrier frequency are both 3579545/2048
per second. Gray levels are conveyed by a combination of phase and
amplitude modulation. 2 phases (180 degrees apart) and 16 amplitudes.
Each pixel is one audio cycle.

This is fine for a phone line or FM radio. Let's perform a thought
experiment about what would happen on SSB ...

Suppose your tuning was off by 20 Hz. The receiving end expects one
pixel per audio cycle and would gather the pixels at 1727 or 1767 per
second while the sender is producing them at 1747 per second.
The phasing would be all messed up. AGC and QSB would also mess up the

amplitude modulation of the audio carrier.

Several people have proposed using the Visitel for HF SSTV but I have never heard of any success. I would be very interested in hearing more about people's experiences with it.

If you would like to try SSTV at a low cost use your home computer.

* AEA has an interface for the Amiga for about $300.

* SPEC-COM has SSTV software for the Radio Shack COCO. I think it was about $40.

* A color SSTV program for the Atari ST is available from several user groups. It requires a simple interface that can be built for about $7. See 73, December 89 and January 90.

* I have a vague recollection of a product for the IBM PC from a company named something like Computer Systems Consulting. But it was only black & white. You don't see too many B&W pictures anymore.

In summary,
- The Visitel is not compatible with any of the ham SSTV modes.
- The Visitel modulation scheme can't be decoded by the usual Frequency to Voltage demodulators.
- I seriously doubt the Visitel would work over an SSB radio. (Please, someone - prove that I'm wrong!)

Color SSTV can be very expensive but it doesn't have to be anymore. If you must have 262,144 colors, spend $1295 on a Robot 1200C. If you want to make only a small investment to try something new, use one of the systems based on a home computer.

I am attempting to build a low power fm transmitter. The
circuit calls for NPO ceramic caps, however these little buggers
are quite difficult to locate. The local radio shop suggested
that I substitute silver-mica, however I have been told that silver
micas 'fail' at much over 50MHz. The circuit in question will run
88Mhz (part 15) and then be adapted to 144MHz (ham band).

Any ideas on where to locate NPO's are what to use as a substitute??

BTW - the values are 330pF, 0.1uF, 0.001uF

Thanks in advance es 73's

Jim- NPO ceramic capacitors are generally used in a circuit
because of their retention of a fairly constant capacitance over
temperature, NOT because they are particularly better-suited at
VHF than other types. (that came out a little more confused-sounding
than I thought it would, but I think you get the picture). Silver
Mica capacitors work EXTREMELY WELL at the lower to middle VHF
frequencies. The only real warning is that the breakdown voltage
ratings of these capacitors can be more easily exceeded at VHF than
maybe some other types of caps, but their value is stable and their
self-resonant frequency is generally high.

Typically, you'd use an NPO ceramic in a frequency-determining
circuit (such as an oscillator) or other circuit where the caps'
characteristics need to be stable over temperature. However, there are
other types of temp-compensating caps (N470, N750 to name two) which
are also popular, but have very different temperature coefficients.
Their drift (characterized by type) can be used to stabilize an oscillator
which is drifting in the opposite direction.

If the circuit in question is not an oscillator, or
something equally critical, then probably almost any ceramic cap
or silver mica will work fine.

I hope this helps and doesn't confuse you more.

My appeal for information regarding the possible identity of a
ceramic object connected with a crime has yielded a great deal
of response already but so far no success. The suggestions that
have already been mailed suggest certain clarifications are needed.

The object is a "solid" cylinder of glazed (or perhaps polished)
white ceramic with a diameter and a length both 7/16 of an inch.
There are no markings on the object and no holes of any sort or
any obvious means for mounting. All the surfaces have a similar
smooth texture while the two edges are slightly and smoothly rounded.
(All in all it bears a striking resemblance to a mini-marshmallow
of the sort one puts in hot chocolate.)

One respondent asked whether or not the object is magnetic. It is not.
It is certainly not a ferrite and in my best estimation is a ceramic
closely resembling that used in electrical standoffs. Several
respondents suggested that it is a standoff but the lack of any means
for mounting it or anything to it seems to preclude this.

Lastly, these objects were used as projectiles. Is it
possible that these represent some standard ammunition for a gun
of a sort that I have never encountered before?

Again, if you have any idea of the applications or origin of such an object
please e-mail me directly as this information may be valuable in
tracking down the perpetrators. Thankyou very much in advance for
any assistance you can offer.

I couldn't pass this one up...

In article <1990Apr21.060104.20254@lopez.UUCP> arf@lopez.UUCP (Jack Schmidling) writes:
> However, I will take this opportunty to help you understand
> why I consider about 95% of hams, "MUSHBRAINS".

Well, I see you're into digging your own grave. That's useful.

> Most of us can do that with a power meter and SWR bridge.

Which might test your LO, but not much else. You won't learn anything about
band conditions that way. Of course, it wouldn't bother us if your
BROADCASTING was done into a dummy load (a fitting term)...

> ARF: A real crushing flood of feedback, huh?

You should have seen my mailbox after my previous posting.

> ARF: The kind that gets all glassy-eyed when asked anything
> more controversial than "how's my smoke?"

Ham radio is supposed to be apolitical and noncontroversial. That's tradition,
the law, and common sense. Amateur Radio is an international political
football, and some of us havn't forgotten the recordings that anti - ham
administrations played of operations like ARF during WARC '79.

> ARF: Congrats Bob, however there is more to hamming than
> just what your particular narrow interest happens to be.

A cube of sugar in a vat of sulfuric acid.

> You do your thing, I do mine. That's what is supposed to
> make it fun, not a source of conflict.

This is the sort of moral philosophy that fundamentally wrong. It pretends
that "our things" won't conflict. Moreover, it equalizes all actions,
eliminating the concept of right and wrong, or any gradiation between.
"I'm okay, you're okay". Yeah, riiiight.

> ARF: The major deterent to Oscar use is money not IQ and anyone
> who has done it knows that.

I've built OSCAR stations for less than the cost of an HF rig. They don't
have all the bells and whistles like autotracking and automatic Doppler,
but that just means that the op has to have a little upstairs. With the
advent of the pacsats, one can get involved for under $100.

> I lost interest for the same
> reason I lost interest in ham radio in general, its just
> plain boring.

So you've decided to spice things up by becoming the Geraldo of 80m???

> On the Amateur Radio Forum, one can engage his brain in a
> debate on any topic (except ham crap) and hang in there till
> the sun comes up.

ARF is not debate. It's one - sided tabloid hucksterism. Debate is a
structured, BALANCED discussion of relevant issues. Debaters take well
reasoned, persuasive positions, granting arguments when proven wrong.
Debaters do not indulge in personal attacks, unless so attacked. The
junior and senior high school kids that I coach and judge in debate abide
by those rules.

> If you find that a poor use of ham
> spectrum, then I am afraid I find your kind, a poor use of
> human tissue.

Nice try. I know ninth - grade ghetto kids who throw better insults.

2358. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-04-21 20:37:18 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9004220702.AA18721@ucbvax.Berkeley.EDU>
Source record: 12361

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

What's the possibility of hacking the TNC code to refuse connections from another node that has its window size at other than 1 when its own is set to 1?

The ability for almost all the radios on the market to detect a low-battery condition is terribly inadequate.

Not only should they be able to tell you when the battery is low by both visual and/or audible means (user settable), but there should also be a "mode" whereby the voltage is shown on the display. How hard would it be to get 1/2 volt accuracy (which is about all you need in this situation, if that) anyway?

If it comes as a plug option, then I'd also want better accuracy (1/20 volt) and a current meter, too.

ARRL Letter - Volume 9, Number 7 - April 9, 1990 - Part 1 of 3

ARRL TO FCC -- W1AW OPERATIONS NOT PART OF THE DISPUTE

On October 11, 1989, FCC Special Services Division Chief Robert H. McNamara wrote to a number of amateurs seeking comments and information on phone patches, information bulletins and over- the-air telegraphy practice. The letter requested information and insight that could bring a resolution to "the unfortunate continuing over-the-air dispute that takes place on the 20 meter band...which is jeopardizing international goodwill..." The letter asked a number of questions on these topics.

ARRL's response was submitted on November 15, by Counsel Chris Imlay, N3AKD, in behalf of W1AW Trustee, John Lindholm as well as the ARRL. In it, Imlay made observations and recommendations as requested in NcNamara's letter. At the urging of FCC staff, the League in the mid-1970s developed the eleven-point "Phone Patch and Autopatch Guidelines" that appears in The FCC Rule Book (Eighth Edition) at page 13-15. These guidelines have stood the test of time, and are generally accepted as a useful supplement to the Commission's Rules.

The League believes that the definition of the term "information bulletin" contained in the Commission's Rules should be strictly applied and enforced.

With regard to telegraphy practice, the only guidelines needed are to ensure that the purpose of the transmissions is to provide telegraphy practice and not to engage in one-way transmissions that otherwise would be illegal:

- The text should not be randomly generated, since such practice material is readily available via other media.

- The text should be taken from a published, readily available source to facilitate checking accuracy of copy.

- The text should relate in some way to Amateur Radio.

- The text should not be sent repeatedly.

In a letter dated December 21, 1989, McNamara stated that 45 replies were received in response to his letter and that although the responses "contained somewhat conflicting information and views, they were helpful in understanding the issues so that a course of action could be selected." McNamara stated that it appeared that the intensity of the debate has

subsided and that most of those participating in it have recommitted themselves to the basic principles of the amateur service by attempting to resolve such disputes off the air.

He stated that the disputes are centered in three main areas: phone patch communications on the HF bands, information bulletins and telegraphy practice transmissions. McNamara stated that the replies "...confirm that misuse of an important amateur service frequency band was having a major negative impact upon the service. They clearly show that the amateur service was not fully cooperating in selecting transmitting channels and in making the most effective use of the amateur service frequencies as required by Section 97.101(b)."

McNamara stated there were two general views for a solution in the responses. One, that the amateur community should be allowed to solve the problem internally. The second that the Commission should mount a massive enforcement effort. McNamara said the second approach was not possible due to enforcement priorities and budget constraints; if direct Commission intervention proved to be necessary it would be in the form of additional restrictions that may affect all amateur operators. Mr McNamara said "In view of the above, we will afford the amateur community the self-regulation opportunity suggested. To implement this plan, we suggest you and the managers of eight other amateur service organizations.. consider submitting a joint plan for the problem resolution within the amateur community." McNamara suggested that this plan be developed by July 1, 1990.

In a March 19 letter to the FCC, the ARRL stated that, according to letters received by the FCC in this matter, there is no basis for the operations of W1AW to be included in any further discussion. Letters received by the FCC from amateurs indicated that the amateur community clearly hold the W1AW transmissions of code practice and bulletins in the highest regard. There was not a single dissenting statement to be found in the file and thus no purpose to be served by having W1AW operations included in further discussions aimed at resolving the dispute on 20 meters.

As one correspondent put it, "...regarding the telegraphy practice...[and] W1AW...I have a hard time understanding that it is a problem." The ARRL agrees and stated that it does not believe that the W1AW trustee should be a party to the FCC requirement that those involved submit a plan of resolution.

The League did not discount the seriousness of the central issues of the dispute, nor the harm to the Amateur Radio Service and to the public which has resulted from the continuing on-the- air confrontations between amateurs holding differing views. Thus, the ARRL's letter of November 15, 1989, which contains a number of specific suggestions in this regard, was sent to the FCC.

ARRL Letter - Volume 9, Number 7 - April 9, 1990 - Part 2 of 3

ARRL FILES REPLY COMMENTS IN GENERAL DOCKET 89-554

On March 16, the ARRL submitted its reply comments to the FCC's inquiry relative to its preparation for WARC-92. In it the League said that it was gratified to note the absence of comments proposing the reallocation of existing Amateur Radio bands to other services. ARRL noted that a number of commenters representing high-frequency broadcasting (HFBC) interests appear to be seeking expansion of their allocations by about 50%. ARRL said that this additional spectrum might not be needed if the HFBC service adopted single-sideband instead of double-sideband amplitude modulation as its standard and that FCC should consider expansion of HFBC only after it had embraced this and other spectrum conversation techniques.

The League noted that Motorola's forecast for 800 MHz of new spectrum for land mobile in the 1-3 GHz range was "jolting" if not unsurprising. ARRL suggested that some portions of the UHF TV spectrum be considered for reallocation. The increased use of cable, videotape and other spectrum conservation techniques has, in the League's opinion, lessened the need for some of the television spectrum allocations in the UHF region. ARRL agreed with comments made by the American Petroleum Institute which said that while there is a shortage of land mobile spectrum... the situation is aggravated by the operational and technical inefficiencies in use in their current spectrum assignments.

ARRL EXECUTIVE COMMITTEE MEETS

The Executive Committee (EC) of the American Radio Relay League met on March 10 in Washington, DC. Among EC actions were:

- Authorization to file comments in PR Docket Numbers 89-599 and 89-552 regarding the establishment of a Personal Emergency Locator Transmitter Service in the 220-222 MHz band and implementation of the 220-222 MHz land mobile allocation into Part 90 of the FCC rules respectively.

- Appointment of a special working group to evaluate the FCC NPRM in PR Docket 90-55 against the ARRL petition for a codeless class of amateur license, RM-6995 with the objective of developing a strawman ARRL position for distribution to the Board before the next Executive Committee meeting.

- Moved to request a 30-day extension for the filing of reply comments on RM-7248, the League's petition to establish limited segments for automatic control of digital HF transmissions.

The Executive Committee also reviewed the status of a number of ongoing FCC, international and organizational matters as well as ARRL and IARU preparations for WARC-92. The full text of the Minutes will appear in the May issue of QST.

ARRL FILES COMMENTS IN PR DOCKET 89-599

On March 20, the ARRL filed its comments with the FCC in its proposal to establish a Personal Emergency Locating Transmitter Service (PELTS) in the 220-MHz band. The ARRL said this proposal is premature because the FCC's proceeding in PR Docket 87-14 to reallocate the 220-222 MHz band from the amateur to the land mobile service is not final. The League noted that should the FCC's decision to reallocate the 220-222 MHz band be ultimately

reversed there will be no frequency allocation for the private land mobile radio service and that no further action should be taken in this proceeding until the Commissions's allocations orders are affirmed on appeal, and any and all judicial appeals are exhausted.

ARRL Letter - Volume 9, Number 7 - April 9, 1990 - Part 3 of 3

STS-35 MISSION APPROACHING LAUNCH

Ron Parise, WA4SIR, is a Payload Specialist on the Space Shuttle mission STS-35 scheduled to be launched May 9, 1990 from Cape Canaveral. The ARRL Educational Activities Department now has a SAREX teacher's package which includes lesson plans, resource material, informational videotapes and more. You can obtain the package by sending a 10-13-inch envelope with $1.25 postage affixed to EAD at ARRL HQ.

Ron will operate both 2-meter AFSK packet as well as 2-meter FM voice. The packet station (an HK-21 "pocket-packet TNC" marketed by Heathkit) will transmit bulletins providing updates on the mission and will operate in a ROBOT mode where stations on the ground can connect to the shuttle TNC and obtain a QSO number to validate the contact.

Ron is scheduled to operate the 2-meter voice station during his off hours and he will spend the majority of his time talking with school classrooms around the world offering them the opportunity to talk directly with an astronaut aboard the Space Shuttle. NASA has authorized SAREX in order to "encourage youth to become excited about science and technology" and to publicize manned space flight to the general public.

This past week the amateur equipment to be used on the mission underwent EMC (electromagnetic compatibility) tests. These tests are designed to determine the possibility of any interference the amateur equipment may inflict on any of the shuttle electronic systems. NASA has notified AMSAT that all the equipment passed the tests.

With SAREX on STS-35, Amateur Radio may have an opportunity to further the quest for international cooperation in space. Now that Amateur Radio activity on the MIR space station appears to have resumed, AMSAT and ARRL are investigating whether there will be a mutual-visibility window between STS-35 and MIR for a first- ever Shuttle to MIR linkup. Adding to the excitement, the STS-35 Mission Commander is Vance Brand, who participated in the the Apollo/Soyuz program many years ago. Stay tuned to AMSAT and ARRL bulletins as further details become available.

INTERNATIONAL MARCONI DAY

Under the sponsorship of the Cornish Radio Amateur Club, "International Marconi Day" will be held on Saturday, April 21 1990, (0000-2400 UTC).

During this event, approximately 14 stations in 8 countries will be active in the General class portion of 6 HF bands. Each station will represent a location of historical importance in the life of Guglielmo Marconi, a pioneer of transatlantic communication.

All amateurs are invited to participate in this annual event, first held in 1978. A special award designed around a 1912 Marconi Company Wireless stock certificate is available to all stations confirming contacts with 10 or more of the special event stations. To receive the certificate send a copy of the logs and 10 IRCs or $5.00 US to Cornish Radio Amateur Club, Box 100, Truro, Cornwall, TX1 1RX, United Kingdom.

SA-AMSAT BACAR MISSION 90/1 SUCCESSFUL

On March 10, SA-AMSAT launched three balloons carrying Amateur Radio (BACAR) to a height of nearly 50,000 feet above sea level.

BACAR was equipped with an RTTY telemetry unit providing information such as current altitude and rate of climb. The telemetry transmitter's output was in the 2-meter band. Also aboard was a monochrome CCD camera feeding a video transmitter operating on local UHF TV broadcast channel 35 (583.25 MHz). The South African licensing authority was petitioned by SA-AMSAT to use the commercial television frequency so that youth groups and young amateurs without amateur equipment could participate.

The local weather bureau provided tracking support and other logistical assistance. Seconds after BACAR started to ascend, reports of good quality video were received. Later in the flight video reception was reported from as far as Pietersburg, South Africa, a city over 300 kilometers from the launch site.

SB RTTYDX @ RTTYDX $RTDX2004
RTTY DX Notes, 1of3, 4/20/90

RTTY DX Notes for Weekending 20th April 1990.
Part 1 of 3.
BID: $RTDX2004

I was going to say something about the Region 1 IARU Conference held
in Spain recently. Listening to the wails of anguish from the packet
operators when their demands for extra frequencies were rejected 18 to
9, makes one wonder if they going to realize the problems of their
system on the HF bands. Maybe we should rethink the system, and come
up with something that can stand a little QRM.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1ACB, JA1BLV, OD5NG,
TG9VT, VE3JPC, VK2EG, W1DA, W2JGR, W6/G0AZT and the Tri-State DX
Association VHF packet cluster.

RTTY DX Notes, 3of3, 4/20/90

RTTY DX Notes for Weekending 20th April 1990.
Part 3 of 3.
BID: $RTDX2204

QSL Information:

YV0AA will QSL via YV5AJ, the radio club in Caracas.

ZK2RW, Ron will QSL from his home address of ZL1AMO.

HI8BG says to send his cards to Box 163-9, Santo Domingo, Dominican Republic.

FM5WU collects his cards from F6FNU.

TR8JLD QSLS via AK1E.

ZD9RT says to QSL via the ZD9 buro or ZS3WJJ (see notes).

AH3C/KH5J will QSL via OH2BN as soon as the logs arrive.

Notes Of Interest:

First, Spratly is active on CW, but nothing reported on RTTY as yet, but they say that they will be on RTTY soon. Crossed fingers.

ZD9RT or ZD9TR is a bit of a mystery. He says to QSL via the ZD9 buro, there is not one, or to QSL via ZS3WJJ who is not listed in the 1990 call books. Work first worry later.

S2 Bangaladesh, should start soon, if all goes well, though Jim Smith has not been heard for the past week. But keep hoping.

ZS8MI, Marion Island operator has returned home so his cards should be available soon, we hope.

Nothing has been heard about the Cocos Island TI9 operation of late. One wonders what is happening, if anything?.

Some say that the cards for JT0DX are starting to appear. Others say not. This also applies for the TT8AG cards, but hope never dies.

To those going to Dayton, have a good time and dont talk too much.

GL DE DX1 (VK2SG) via TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA
/EX
SB DAYTON @ RTTYDX $KT7H$0421
Digital Suite at Stouffers

Digital Suite at Dayton!

Just a reminder. . . .all packet, RTTY, USENET, and Fidonet hams are invited to a party Friday night during the Dayton Hamvention in suite 425, at Stouffers Hotel, 5th & Jefferson in downtown Dayton.

Come to room 425 after 8pm. BYOB, no smoking.

73,

Tad

2364. GOES Rebroadcast

Newsgroup: rec.ham-radio
Date: 1990-04-22 08:46:08 UTC
From: mgb@TECNET1.JCTE.JCS.MIL
Message-ID: <9004220846.AA19197@tecnet1.jcte.jcs.mil>
Source record: 12366

I have recently developed an interest in weather satellite reception and have been reading everything I can on the subject, including the info that gets posted here from time to time.

I ran across some information that I have never seen posted before, so I thought I would share it with all the others out there that are enthused about image reception.

It seems that you don't need as much equipment as you might imagine to receive images from the GOES geosynchronous birds. These satellites send a lot of data back to Earth, but most people are messing with the WEFAX stuff, but even then you are looking at a downconverter and various other stuff that I won't go into detail on here.

Anyway... what I found out was that there is a REBROADCAST of these signals on TVRO satellite Spacenet-3 Transponder 17. What you need to do is grab the baseband video out of the TVRO receiver and run it over to your general coverage HF rig. Tune the HF rig for the following freqs:
1.9315 MHz GOES EAST
1.8840 MHz GOES WEST
1.5720 Mhz Weather Charts

This rebroadcast seems to be in an HF WEFAX format with 120 LPM and what appears to be an IOC that also agrees with HF. I used my scan converter with AM detection and had best results receiving the signals with the HF receiver in FM mode. I still have not really deduced just what IS the best way to receive this stuff... but that is mainly because I really have no expertise yet and am just hacking at it. Be that as it may, I DID get pictures. I would say that I don't have enough IF bandwidth and that may be preventing really GREAT picture reception... but it does work!

So if you are into weather satellites and happen to have a TVRO system, this is definitely worth investigating! If anyone has the real details on this rebroadcast, I sure would like to hear from you.

>obviously works because I get a turn on thud.

The turn on "thud" only indicates that power is being applied to the
audio section. It does not necessarily indicate that the audio section
is good.

First try some simple checks. When you adjust the volume control, does
the bargraph track? When you adjust the squelch does the channel busy
led come on at any point? If the bargraph tracks your control system
is probably ok and if the squelch led works the receiver is probably
ok. Now if you have or can borrow another band unit, you should check
if that works. If it does, the problem is in the 29a band unit interface.

The receive audio path of this radio is as follows:
Audio from the detector in the band unit is fed to an interface unit
called the "front end unit" inside the band unit. There it is converted
to balanced and placed on the bus (the ribbon cable tying the band units
and the control units together. In the control unit the audio is pulse
code modulated and multiplexed onto the data stream going out the fiber
optic cable to the other control box. In the front control box it is
demuxed and decoded passed through a mute switch and a gain control
stage then sent to the output amplifiers through a routing system depending
on whether you have the band unit selected as main or sub. If main is
selected the audio drives spkr 1 jack, but if sub is selected audio
first drives spkr2 jack and if a spkr is not plugged in, then loops to
the main jack. So try selecting your suspect band unit as "sub" since
the audio goes through a different output amplifier. If this fails, your
problem is probably in the digital audio chain.

Hope this is useful

What is a reasonable price to pay for a used Kenwood R5000?
Other than exchange differences, are there differences between
US and Canadian prices? I have the impression that US prices are lower.

Thanks, in advance.

Subject: Lots of Questions

------------ Letter Body Part 1 - Text ------------

Hello All!
I have recently had my interest in Ham Radio rekindled and I have
decided to go ahead and take the exams. I plan to go for the General Class
licence some time in May. I have been looking around at all the equipment that
is available and I have about one million and one questions. So if you don't
mind I would like to ask you a few!

I plan to spend around $1500 and I am most interested in the HF bands and
DXing. A few people I have talked to have recommended the Kenwood TS-440S.
If anyone has any thoughts on this rig I would really appreciate hearing them.
If you have any other recommendations, I would also be very interested in them.

As far as antennas are concerned, some people have told me that I will do
just fine with a simple vertical antenna. Others have said that it is worth
investing in a beam. What kind of antennas would you recommend? If I get a
beam, will I also need a rotator? Is it worth the extra cash? I have seen
a lot of adverts for antennas, some of which say that they are pretuned for a
particular band, or that they can automatically switch from one band to
another. Will I need an antenna tuner if I use one of these antennas?

One final question (for now anyway!!), I know all this infomation will
be in a book somewhere, so if anyone could recommend a good book too, I will
be very grateful.

If you send your mail directly to me, I will summerize to the net.

Thanks in advance,
Andy Greenshields [dxandy@widener.BITNET]

Yep, long-path propagation DOES occur on 10 meters. I have worked a number of Europeans from Hawaii via the South path, about 26,000 miles, using a vertical 1/4 wave and 100 watts. The antenna was mounted on the South side of a condo, with complete blockage of the short path signals. Generally the contacts took place well after dark here in Honolulu, as late as 11 or 12 pm. It's easy to tell when the band is going to open to Europe via long path, since there is an obvious progression of propagation: first we'll hear the ZL's and VK's, then VK6, then ZS, then Europe as the evening goes on.

10 meters is an amazing band.

>always, Mike

Yes, you can probably use these TWTs successfully at 10 - 10.5 GHz!!!
TWTs have very wide bandwidth. You probably won't get the rated gain
out of them, but you will probably get useable gain (>= 5dB). I have
done this on X-band. You will probably want to use a very strong
electromagnet, even stronger than the original one used in the
amplifier (if you are starting with a whole amplifier). This will yield
higher effeciency.

>
> what's the difference between so called Pulse operation and
> N0N? Where is the line drawn between Fast N0N and Pulse?
> Any rules of thumb out there? Anyone care?

In pulse operation, the duty cycle is usually less than 1%. I would
suggest perhaps (duty cycle <= 2%) == pulse, (duty cycle > 2%) != pulse.

On another note, I would like to see the restriction on pulse emissions
in our X-band lifted. (I know why it's there; if you want to know, just
think about what you could do with a mobile transmitter with a "pulse"
frequency carefully chosen. However, the law is toothless, because a
string of dits at the same carefully chosen rate has the same effect.)
If we could use pulse on X-band, we could achieve very long distance
communication reliably over very long (over the horizon) distances.
This would be an excellent technology to build a high speed inter-city
packet backbone with. Oh well, we can still do this legally at 9cm or
6cm or 11mm.

>to 1?

You'd have to do it heuristically. If you delay your acks a bit, you'll know that a sender's MAXFRAME is greater than 1 when you see a second frame come in before you have transmitted the ack for the first frame.

I should say it would be a bad idea to actually implement such a rule. As much as I'd like to see people run AX.25 in stop-and-wait mode, I think the Robustness Principle is more important.

Simply stated, the Robustness Principle says "Be conservative in what you send, liberal in what you accept from others". Come to think of it, that's not bad advice to the participants in a certain flame war already consuming this newsgroup...

2378. Scanner help needed

Newsgroup: rec.ham-radio
Date: 1990-04-23 14:06:37 UTC
From: thackery@motcid.UUCP
Message-ID: <2523@lime14.UUCP>
Source record: 11985

I recently bought a handheld Scanner from DAK, Regency R 4030, that boasts 800 MHz band coverage. Well actually it gets part of the 800 band on the high and low side, but the middle of the band has been locked out. I was wandering of anyone new of a quick fix that will "unlock" these frequencies. Since the PLL is capable of capturing even up into the 900 MHz band I assume it's not a problem with the capability of the unit but rather Regency purposely is restiricting these channels.

I had heard about clipping some diodes or something like that. This scanner looks identical to Bearcat scanners except for some of the plastic colors. The R 4030 is a 200 channel programmable handheld if that helps any with identification.

thanks,
doug

2379. Microsat Keplerian Elements

> had a false sense of security standing behind the antenna. ??Am I
> wrong about this???

No, you are not wrong. At 225 MHz, the ANSI RF Protection guidelines in terms on the mean squared electric field strength is 4000 volts squared per meter squared, and the magnetic field strength is 0.025 amps squared per meter squared. These are for near field exposures. From the antenna you briefly described, the front to back ratios are typically on the order of 3-6dB. So, depending on the power, the technician could have eaisily been exposed to RF radiation which exceeds the ANSI guidelines. (There are other considerations, also. I'd recommend reading ANSI standard C95.1-1982, Safty Levels with respect to human exposure to Radio Frequency Electromagnetic Fields, 300kHz to 100 GHz).

>
> 2 In the above mentioned RFI testing, the signal level was measured
> in volts/meter, and yet transmitter power is measured in Watts. How
> does one convert between these units?

The "volts per meter" is the electric field intensity. The quantity used to describe the power associated with an electromagnetic wave is the Poynting vector, which is the vector cross product of the electric field vector with the magnetic field vector. The average power radiated by an antenna is found by integrating the Poynting vector over a sphere surrounding the antenna.

> You hear talk of delivering
> X volts into a Y ohm antenna load giving XY Watts. Presumably, the
> volts/meter is the X voltage divided by the dimensions of the
> antenna?, or is it divided by the wavelength?, or is it divided by
> the spacing of elements in the antenna???

None of the above. In general, to determine the potential given the electric field, one must evaluate the line integral of the electric field over the path for which the potential is to be referenced.

> In any case, it would seem
> that the volts/meter is a better measure of the radiation of an
> antenna since it is representative of the signal after it has left the
> antenna.

> If this is true, why does
> FCC regulate the power of the transmitter, but not the volts/meter
> emmission???

True -- the volts per meter is a representation of the radiation of an antenna. Another is the effective radiated power (ERP), which is the product of the antenna input power and antenna gain. Suppose an antenna receives 1kW and has a gain of 3dB (in the direction of maximum gain). The effective radiated power in this case would be 2 kW.

Both the field strength (volts per meter) and effective radiated power are widely used in the broadcast industry. Why is this not used in the amateur rules?? I would guess its because there are so many variables involved, making it more difficult to control ERP or field stregth. The variables are: transmitter power output, transmission line loss, mismatch between transmitter and transmission line, mismatch of transmission line and antenna, the type of antenna and gain of the antenna, the point where you measure the field strength (100 feet or 1 mile from the antenna??). All of these can eaisily be measure for a fixed transmitter as would be used in the broadcast industry, but would become difficult for an amateur transmitter (since it is not fixed to a specific frequency, the characteristics may change).

Mike (and others interested),
Contact wa6exv in Ridgecrest California. He had an oven source phaselocked
and putting out 600+ watts well before the RF Design thing came out.
Chuck is one of the founding fathers of the San Bernardino Microwave Society
and a great amateur microwave enthusiast.
Chuck was interested in getting an EME source and as I remember had pretty
good luck using raingutter down spout pipe for cheap lowloss wavequide on
the band. He should be good in the callbook.

Ken,
I don't think pulse privileges really are that much of an issue in preventing effective use of the band. As I see it, the main advantage would be in using surplus hardware. However, moderate power narrowband equipment is no longer a difficult proposition. Very long links and OTH links require optimum use of the resources; reasonably efficient use of the spectrum (bps/Hz numbers) and highly directional beams to avoid waste and QRM; as well as physically larger receive antenna apertures to recover the information. Even so I suspect that for reliable networks and comm. channels we are likely to end up with a larger number of shorter LOS links instead of long haul OTH ones. Troposcatter is a fairly predictable propagation mechanism at 10 GHz (see my description of an experience with it on a 400+ mile path during the 1987 10 GHz terrestrial DX record outing in December 1987 QST) but long haul links are inherently lossier and less reliable than shorter LOS ones.
I strongly agree that we need to use our microwave resources and in particular 10 GHz but I think we will end up finding that for efficient use of our amateur resources we will start looking more like the telephone companies and common carrier folks when we solve the backbone problem.

The objects you describe sound like the mixing balls used to mix and grind fine powders. The trade name is BURUNDUM and they are made in various sizes by U.S. Stoneware Corp. Since BURUNDUM is an electronic grade Al2O3, they are very hard. You ought to measure the density (density of Al2O3 is 3.96g/cc) to verify. Also try to break one apart (use caution because these little pellets will shatter and make shrapnel) to see it they are homogeneous. Hope this helps, Laszlo

If you are in Texas and your girlfriend is in New York, it would have to be an HF system of some kind (Distances are too long for VHF). I would suggest a radio that can cover the 20, 15, and 10 meter bands anyhow and general class licenses to operate voice over them.

These radios could probably be picked up at a ham auction or hamfest for about $200 each.

There is going to be at least one problem with this. How can you coordinate this so that you will find each other on the radio? You may be able to pick a time and frequency in advance. Also, how well the radio waves travel varies depending on time of day, month of the year, and this 11 year sunspot cycle that also is an influence. This will tend to complicate picking a time and frequency as above.

Go for a good antenna. I recommend a 3 to 5 element beam up on a tower. It is probably more cost effective to get a better antenna than another radio, since the antenna halps on both transmitting and receiving. Antennas and the towers can be expensive however, and may end up costing you more than you paid for your radio.

You may also want to check out whether using ham radio to avoid a toll charge is really legal.

Good luck.

Effective today, both north and southbound I-75 are 1 lane ea. Suggest trying an alternate route to HARA Arena if you are arriving from the South. Some possibilities are:

1. Take the Salem Ave. exit, take Salem Ave. to Shiloh Springs Rd, turn right. (Lots of traffic lights, but good 4-lane streets).

2. Take Main St. Exit (SR 48), turn left, take 48 to Shiloh Springs RD, turn Left to Hara. (Likewise, lots of traffic lights).

3. Take Miamisburg-Centerville (SR-725) exit. Turn left on SR-725. Take 725 through Miamisburg, and turn Right on Union Rd. Union Rd is about 2 Mi WEST of Miamisburg. Take Union road about 12 Miles North through Trotwood, OH to Shiloh Springs Rd. Turn Right to get to Hara. This is a country-road route. Note: there is a rather laborous hill west of Miamisburg on 725. Heavily laden trucks (Read: full of boat-anchors) may wish to avoid this route.

>no response from ARF. Of course, I probably didn't put it this politely.

>> ARF says:
>> Drivel? What do you call "five nine in New Jersey"?

Well, just a short comment: I (and possibly others) would just as soon that "flame wars" regarding Jack's opinions OR his manner of expressing them be taken either to e-mail or to alt.flame; I'm not sure they have a place here. As for me, while I certainly don't agree with all - or possibly even *many* of Jack's opinions, he is certainly well within his rights to have them AND to express them, as long as he doesn't get (A) personally abusive or insulting or (B) obscene. So far I have seen neither behavior *initiated by Jack*. Finding someone else's opinions offensive - without them directing personal attacks at you - is not sufficient reason for calling for their censure. If you don't wanna listen, one of the great things about radio is that you can always reach for the VFO dial. I myself get tired very quickly of the "you're five-nine, QSL?" variety of contact, but find most folks for some reason simply assume that Most Things Shouldn't Be Discussed on the Radio. (Just like that, caps and all - a taboo handed down by the Radio Gods.)

I do have a couple of questions I've always wanted to ask Jack, though, and assuming that he's still following this string, now's as good a time as any: First, why is it "ARF says" rather than "Jack says?" Do you consider yourself to BE the forum, or are we to assume that the opinions of everyone in the forum will agree with those you present under "ARF says?" I doubt that you intend to give either impression. Second, and this is more along the lines of a Gentle Suggestion than a question - don't you think that many might find the "lighthouse of wisdom and truth" bit to be just SLIGHTLY arrogant? Hopefully, a number of diverse opinions could be brought to your forum, and certainly not ALL of them could be considered "wisdom" and/or "truth." I'd also hope that you do not intend to give the impression that your own opinions are infallible. Perhaps a better slogan might be "SEEKING wisdom and truth", if that truly is what you intend. Not a flame, Jack - just a comment from Another Observer.

> 6cm or 11mm.

Am I missing something? It seemed to me that you wouldn't benefit from a low duty cycle when fighting a large path loss. I would think that some synchronous system, with correlation detection of some sort, would be the best bet. Of course you COULD build a receiver that just listened during the narrow pulses to ignore the in-between noise. I'd also worry a bit about pulse-spreading due to multipath. Maybe a pseudo-random scheme would be a good approach, but would likely have a mid-to-high duty cycle, and thus not be pulse.

Or do you have a good source of low duty cycle 10 GHz power, and want to build a system around it?

Pardon the confused questions, but I don't normally think of low-duty-cycle pulse transmission and weak signal operation as going together.

Bob W3OTC

PS. Look at the picture of the 10 GHz SSB PHONE station in QST (I thought in W3XO's column, but can't find it.) I've seen and heard '3XO's video of it operating over a non-line-of-sight 25 mile path with excellent sigs.
The power output was in the 20 - 100 mW range, I think.

Source record: 11999

The following anonymous FTP sites have mininec3:

For North American users:

host = wuarchive.wustl.edu
path = mirrors/msdos/hamradio/mininec3.arc

For European users:

host = kolvi.hut.fi
path = hamradio/simtel/mininec3.arc

The later one implies that mininec3 might also be on wsmr-simtel20.army.mil
but I cannot verify it at this time (unreachable) and I also do not have a
directory of available files there since I cannot get them from hosts other
than BSD UNIX or look-alikes. If you do have UNIX, you can obtain the files
I do have of anonymous FTP listings with the following shell script:

```
#!/bin/csh
ftp -n -v 128.174.5.98 << EOF
user anonymous
cd phil.513
binary
get afindex.tarz "|zcat|exec tar xvf -"
quit
EOF
```

The host has a 5 meg compressed tar file. The above script will directly
uncompress and extract this file into several files in a subdirectory and
occupy around 20 meg. Check your space with "df" first.

Non-UNIX users: you will need a UNIX compatible toolset with LZW uncompress
and tar extraction capability. I intend to make the files available as
individuals at some future date, but the host system (CMS) the anonymous
FTP is on does not allow the necessary names.

I received some email from W3OTC that I responded to, and thought a
posting would be appropriate. Here it is:

% From: Robert Carpenter <rc%cmr.ncsl.nist.gov@usc.edu>

% Am I missing something? It seemed to me that you wouldn't benefit from a
% low duty cycle when fighting a large path loss. I would think that some
% synchronous system, with correlation detection of some sort, would be the
% best bet. Of course you COULD build a receiver that just listened during
% the narrow pulses to ignore the in-between noise. I'd also worry a bit
% about pulse-spreading due to multipath. Maybe a pseudo-random scheme would
% be a good approach, but would likely have a mid-to-high duty cycle, and thus
% not be pulse.

It is a possibility to build a receiver that only listens when a pulse
is supposed to occur, but that wasn't necessarily what I was thinking
about. The advantage of using the high peak power of a pulse is that it
would be EASILY DETECTABLE even with high path loss. This means that
(in theory) you could set up a data link much like CW is used with the
human ear: the presence of a pulse has one meaning, and the absence of a
pulse has another. There is probably even a better way to do it:
consider what you could do if you were to phase modulate the pulses. In
other words, control the time delay or latency between pulses. A short
time delay could mean a 0 bit, and a long delay could mean a 1 bit.

% Or do you have a good source of low duty cycle 10 GHz power, and want to
% build a system around it?

No, I don't have a 10 GHz pulse source, but they are available. Now if
we could only use them legally ...

% Pardon the confused questions, but I don't normally think of low-duty-cycle
% pulse transmission and weak signal operation as going together.

Most people don't. Certainly, I'm not suggesting that real time
communications like voice be sent this way. I'm merely proposing that
this might be a good use for part of our microwave spectrum. The packet
guys are in great need of high-speed inter-city links (among other
things).

% Bob W3OTC

% PS. Look at the picture of the 10 GHz SSB PHONE station in QST (I thought in

% operating over a non-line-of-sight 25 mile path with excellent sigs.
% The power output was in the 20 - 100 mW range, I think.

I've done better than 40 miles over non-line-of-sight paths with only 10 mW and CRUDDY WIDEBAND FM! This was with 2 foot dish antennas on both ends of the path at X-band. Still, I'm not pooh-poohing their efforts; I'm just trying to show that even with simple cheap equipment you can do a lot more than most people expect in the SHF and EHF spectrum.

>is simply broken beyond repair.

I'm a bit perplexed by this statement considering how much traffic AX.25
moves each day even in the hostile environments like HF. If you mean that
there are features in the AX.25 protocol that you find distasteful, then
I agree, and we'd probably even mostly agree on what's distasteful.
But in my book, something that works even a little bit is not "broken beyond
repair."

>Given the high levels of congestion, AX.25 can run in one of two modes.
>Set the window size to 1 as you're "supposed to" (as Phil has proven) on

>out). Needless to say, most TNC users keep their windows larger than 1.
>Especially our large local NTS bulletin boards. And they don't give a
>s*it when yo tell them to fix it.

You are confusing poor RF engineering with protocol deficiences. I think
we'd all agree that most any protocol, especially any CSMA protocol will
perform poorly on simplex networks, especially those based upon simplex
digipeaters. On the other hand, a properly engineered full duplex RF
environment is practically immune from collapse. I've proven that
pretty conclusivly here on the 146.73 LAN channel.

>You'll note that much of BBSnet is one-hop "message switched"
>non-real-time mail. That's not even "packet switching", but store and
>forward BBS operation. Nothing wrong with it, but it's slower than it
>would have to be if the underlying network were better.

BUT... Store-and-forward most suits most hams' needs just as store-and-
forward usenet news suits most readers here. Store-and-forward does
not have to be slow. Again let's not confuse problems in a particular
implenentation with problems with the concept. Sure W0RLI's once an hour
forwardind model is slow. On the other hand, I can show you a commercial
system I've designed and implemented that is NOT slow.

>TCP/IP, on the other hand, has dynamic retransmit timers and selective
>recovery of lost packets. So if you get clobbered, you don't have to
>retransmit the rest of the window, and you can run a larger-than-1
>packet window size. Of course, sharing a channel with AX.25 is a clear
>case of the obnoxious driving out the polite...

Or more accurately perhaps, a protocol with characteristics more suitable
to the RF environment is driving out one that is less suitable. Features
do not make functionality. Dynamic retransmit timing, selective recovery
and the like do absolutely no good if they are not appropriate to the
environment. If the backoff algorithm falsely attributes a retry
to a collision (which it must) and backs off into oblivion when the
lost packet was actually lost because of poor signal conditions, then
it does not fit the application and performs worse than an "inferior"
protocol that is better matched. At least around here, most of the
time, a bit of hammering will get a packet through.

>Need I mention digipeaters?

I guess digipeating and the emotional hate directed at it is the focus of
this philosophical debate. I'll stipulate that digipeating is a hack and is
little better than aloha in terms of thruput. You'll also have to agree
that despite its warts, digipeating gets the traffic through.

This is the same problem I face as a development manager. Do I fail
to deliver a product to a customer because some needed feature is
missing or do I put in a quick hack that works less than optimum
and ship it? My customers invariably say "hack it". And my superiors
are generally happier with the latter approach.

It's the same for ham radio. Do we tell potential users that we can't
connect 2 areas because digipeating is grody or do we put a digi up
and live with the lousy but greater than zero thruput? To me
the answer is obvious.

Or do we put up a technology that does not work very well, is hard to
use and is unreliable but is "pure" or do we put up what the users
want and what works best? Again, the answer is obvious. I hope you
keep in mind my distinction between productions and experimental
networks.

I once again seem to be casting myself as the great defender of AX.25
and the currently stagnant environment that exists. Such is surely
not the case. I look forward to the day when a fast and reliable
network exists that is practically transparent to me as a user. I suspect
that this day will not arrive in my lifetime. Those who promote TCP/IP
as the next best thing to God tend to fool even themselves with promises
sometimes. We tend to brush complexity under the rug with terms like
"automagically". And we tend to represent the ham radio network with
the same nice cloud model as we use for commercial models. Sure the
Internet is accurately modeled by that cloud - a status that has
taken millions of dollars and man-hours to achieve. A more accurate
model for ham radio in the forseeable future is a series of disjoint

line segments separated by air.

Phil's code is a very accurate duplication of the environment one finds
in a Berkley IP environment. (And it would be an accurate model even
if phil decides not to emulate the kernel panics :-) It works fine
on the ethernet or on SLIP. I use it everyday for that environment.
And when something breaks the network, I can fix it and am paid well
for doing so.

But when we throw this same environment onto non-sophisticated hams,
the situation is quite different. Not only is the user interface
alien, hard to use and cryptic, we have moved all the complexity of
network management off a few nodes and into each ham's shack. This,
I submit, is negative progress. Promises of future servers to address all
problems do not aleviate the situation.

But even this is somewhat tangent to the point I was trying to make
earlier. The point is that once we become service providers - and I
enjoy that role almost as much as experimenting - we have an obligation
to take our users' time and money and spend it wisely. Erecting
networks that don't work or which don't fit the users' needs is not
wise management.

Between IP not working very well, the vendors' headlong rush toward proprietary
protocols for RF faster than 1200 bps, and the limited time available to
the worker bees, I see 1200 bps AFSK being the lowest common denominator
for quite some time to come. Anyone who wants to prove me wrong on this
should a) design a cheap transverter front end for our WA4DSY modem, b)
design a high speed driver for said modem, c) design something faster and
better than our kit and d) put them in kit form that can be easily obtained
and assembled. One should probably also pick up the phone or the pencil
and contact the packet vendors and tell them to cut the proprietary shit
and agree on a high speed standard and then to start building some hardware.
Dale's 56kbps modem can be had for a song. In the absence of anything
better, it would make a quite nice standard.

I'm afraid, though, that the highest production from the ham community
in the forseeable future will be that commodity, hot air. I sure
hope I'm wrong.

John

Fixing radios seems to contain a large amount of knowledge gained
from experience. When I talk to different people they all seem to
have little tricks to find problems. Is there a book (or whatever)
that compiles all/a_lot of such knowledge for my own experiences, or
is it just something you can only learn by screwing up or wasting
a lot of time? I do have the basic books like the Radio Amateur's
Handbook, but I was looking for a dedicated text with lots of _lore_
and lists like: "if this happens, it is likely that...".

I would not expect such a book to be the "magic cookie" to solving
broken radios, but just a good push in the right direction. I
realize, that a lot depends on intuition derived from experience.

Digital doesn't really bother me, its the RF and analogue.

A friend of mine who is studying for his license wants product information on the Kenwood TS140. I do have their data sheet, but a review or personal testimonials would be better.

I looked back through a few issues of QST product reviews, but didn't find any.

Does anyone remember seeing a review or comparison of the TS140? Or better yet, do they have such a review that I could get a copy of? Just the name and date of the magazine would be appreciated. I'll try to find the issue.

Thanks

John Anderson

Message-ID: <383
Source record: 12000

First of all: sorry for posting this article here; I also sent it to the PACKRAD list, but i didn't receive mail from PACKRAD for over 5 weeks. Maybe there's trouble with my local fileserver...

PRE-ANNOUNCEMENT:

For all those of you who wondered, "why not make PR with a simple modem and some cleverly written software like the DIGICOM folks on their C64" - here's the good news:

BAYCOM - as it will be called - is about to be released!

The writer of BAYCOM is Flori, DL8MBT, who had also written DIGICOM! BAYCOM will include all features of DIGICOM (remote commands, screen editor etc.) plus many features more.

What do you need to be QRV with BAYCOM?

Simple question - simple answer: all you need is a PCompatible computer and a serial port - and a modem. The modem is built around the TCM 3105 modem chip and gets it's power out of the RS232 from the PC. Costs: < $30 !!!

BAYCOM has been demonstrated on Saturday, April 21st at the Frankfurt PR-meeting.

I will post more accurate information on BAYCOM as soon as Flori, DL8MBT and Johannes, DG3RBU, will tell me about this exciting new product.

If you have some questions to DL8MBT and/or DG3RBU, you can write them to me - I'll relay them to Flori and Johannes.

REMEMBER - THIS IS ONLY AN ANNOUNCEMENT! DG3RBU told me, that BAYCOM will will be tested for about one month before the first "official" release leaves their test benches.

Have fun with PR! Vy 73 de Ralf, DF1RW

>I agree, and we'd probably even mostly agree on what's distasteful.
>But in my book, something that works even a little bit is not "broken beyond
>repair."

No, in my book, a protocol is broken if it fails easily. Any hack will
work under best-case engineering. A protocol should handle the worst
case that it's used for. Thus, we're arguing semantics of "broken".

Incidentally, we have a guideline that if a protocol fails if you throw
a bogon at it, it's still broken. A robust protocol ignores crud and
does its best. But that's asking a bit much for now...

>You are confusing poor RF engineering with protocol deficiences. I think
>we'd all agree that most any protocol, especially any CSMA protocol will
>perform poorly on simplex networks, especially those based upon simplex
>digipeaters. On the other hand, a properly engineered full duplex RF
>environment is practically immune from collapse. I've proven that
>pretty conclusivly here on the 146.73 LAN channel.

Again, if you give it a good physical channel, even the worst protocol
will often "work". AX.25 was designed for packet radio. It doesn't
work reliably over _most_ packet radio. If I had a FDX repeater for
packet, I'd be happier, but that's only moving the problem downwards.

I also support faster modems, etc., but I fear that appliance AX.25 with
1200 bps AFSK is a common "bundle". Both are deficient; if you're going
to replace one, you might as well replace both.

I agree that the _implementation of TCP/IP is not yet suitable for
average hams. That's why the "anticomputers" should do it! The
backbone should be TCP/IP, but simple/cheap (even AX.25 one hop) access

should remain available for at least the time being.

2412. Morse Coding standards (non-ham question)

Newsgroup: rec.ham-radio
Date: 1990-04-24 22:01:21 UTC
From: dube@cpdvax.csc.ti.com
Message-ID: <9004242215.AA02030@ti.com>
Source record: 12012

I think that this IS a ham question, and a good one at that.
"Babst TA 64837" asked if there are standards for manual coding of Morse Code. I'm not sure of what the actual standards are, but I think that the spacings are something like: a dash is three times as long as a dot; inter-character spacing is about one dash long; the space between dots and dashes within a character are about one dot long; and the inter-word spacing is about three dashes long.

Whatever, there are lots of hams who would do well to consider the effects of spacing when they send. Some of them run characters, words and groups together to the point where they're almost uncopyable. Other people sort of "mix them up" so that you get semi-words; or they vary their speed and spacing. It's amazing how much faster you can copy when the sender is going at a steady pace, and uses good spacing techniques.

I think the best senders are those with a music inclination. They seem to be able to carry the old rhythm over to the brass. Some of them get positively lyrical with their sending; they're a pleasure to QSO with.

73,
Dube Todd N5PDK

What is a reasonable price to pay for a used Kenwood R-5000? Perhaps in the neighborhood of $700 to $750. Just noticed this unit (used) with mods for $750 in the current issue of MONITORING TIMES (in the classifieds). Universal Radio in Reynoldsburgh, OH might be better able to quote the going rate. The price for a used unit without mods would be much lower. The Universal number is: 1-800-431/3939. Ask for Jim.

And I have no vested interest in Universal. I simply find them to be a very reliable dealer that I have had a cordial relationship with over the years.

Source record: 12020
Cross-posted to: rec.ham-radio,rec.radio.shortwave

I live in Marquette Michigan, the land that time forgot. It is not the end of the world, but you can SEE it from here.

I am NORTH of all the Canadian Population Centers. This is the Upper Peninsula of Michigan. The ARRL in 1971 on their official call area map said I am in VE3. Nope. This is 8 land, but north of the world as YOU know it.

This is an article about radio reception and transmission, and is being posted to rec.ham-radio AND rec.radio.shortwave. Followups, since they will be more technical, will be in the ham group, and I do hope for some responses to this one.

I would like to tell you about the BLACK HOLE EFFECT, a phrase I coined about 20 years ago when I was a very new ham, and a seasoned SWL. Now I am an old timer at both hobbies, have solved a lot of mysteries along the way, and would like to share my ideas on the Black Hole Effect with others on the net, and see if anyone else experiences it, or if I am the Lone Ranger....

Pertanent Details:

Marquette is at 47 degrees North Lattitude. The city is on the shore of Lake Superior, the DEEPEST Largest coldest fresh water lake on this fair planet.

Marquette is on the Mesabbe Iron Range, the LARGEST single deposit of Iron Ore on this fair planet.

Marquette is a place where WEIRD things happen with Radio Signals.

Weird Facts:

There are two Television Stations licensed to this city. Because of FAA regulations, they had to locate their transmitters to the West of Marquette County Airport, out past three Iron Mines. With rabbit ears at my location I do not get a glimmer of a hint that these stations exist. Marquette is the most heavilly TV cabled city in the USA. You have cable or you do not watch TV. EVEN THOUGH TWO stations have studios in town. With a fringe antenna on a 40 to 60 foot tower, you CAN get a signal, but it is not very good. The transmitters are not even 30 miles away.

I used to work for a 5,000 watt radio station. It was 6 miles from the city of license. We never had a decent signal in town. We were fine in Canada and Wisconsin, but in town we were the weak one.

the 250 watter with its transmitter on the hiway was much louder than we were. Our antenna was in a swamp. Our ground system was superb. We just could not get out.

When I moved here, I was an active DX Listener. I loved the AM broadcast band. I found that the AM band here is about 30 to 40 DB weaker than it was in the town I moved her from. Though I am only 100 miles farther north, EVERYTHING is different. Chicago stations that boomed in on a cheapie transistor set require a communications receiver and a very good antenna to receive. BUT Very Distant Canadian stations often blast through. Also, many nights I have gotten BLASTING signals from stations in the Carribean! PJB in Bonaire, Radio Belize, and the Carribean beacon come in like locals sometimes, and during those times, NOTHING ELSE can be heard. Some nights it is only Low Power Canadian stations from Way out.

I do not have a TV antenna, but people who have them report very strange reception. One guy I know claims that he watches movies every night from Canada by hooking his TV up to a CB BEAM. On UHF no less..... We are talking HUNDREDS of miles if he is to be believed....

On HAM radio, the 20 meter band has been totally dead for over a month. I was a regular listener to the 14.313 situation, but all of a sudden, it is gone. It's not my equipment, I have FOUR receivers. They just went dead on 20 in the daytime.

Tonight on 75, I noticed that there is a regular wipeout for both transmit and receive, beginning about 9pm, and ending around 2am. I happened to be here reading the net, when some of my friends in New Hampshire were saying that they never hear me any more, so I went to try and talk with them. They all thought I was barefoot. My Henry was running 1500 watts out. No one could copy me. Then the whole gang faded right out to nothing, and it stayed that way for three hours. Slowly it all came back, and the guys were still on the air, so I came back on and we discussed the Black Hole Effect, which seems to NOT affect anyone else in that group but me. They all continue merrily chatting, and I hear them one by one get fluttery (aroural effect) and then vanish. For three hours the band is completely wiped out, and then slowly it comes back, until around 3am they are all 10 over 9 and so am I.

The theory postulated is this:

The permeability of the earth where I am at is the equivalent of living on a ferrite choke. There seems to be a breakthrough point regarding power level. When I go from 100 watts to 1000 watts, instead of the expected 10db increase, people tell me that my signal is 30 to 40db louder. This is not normal.

I seem to experience a severe aroural effect here that no one else does. The least bit of solar storm activity, and the bands dry up.

What I think is happening is that the combination of high ground absorbtion coupled with high aroura absorbtion yields signals that do not get to the other end.

I call it the black hole effect because it seems that on some frequencies, things can be received that are so far away and should be so weak that it defies logic. I can not transmit on the BCB to see if when I hear the Carribean I can not talk there, so this is only a theory, but I think it is a one way deal. I think the high ground permeability would keep my signal from getting out, while still providing some really wild receiving conditions.

I have talked with people all over the country on the air, and NO ONE else lives in a place like this. I think the combination of being so far north (Into the Aroural Zone), the Lake, the Iron Range, and who knows what else voodo, all plays a part.

A couple years ago a friend from Chicago came up here for a visit. He was flabberghasted when he found the ABYSMAL GROUND WAVE conditions (like the broadcasters up here have to live with). He was 10 miles from town before he could hear me. I was running full power on the 75 meter band. He was just barely above the noise.

BUT before you say "Gosh I could never live there"... Let me tell you a secret.

The black hole effect usually lasts only a month or so every year, though it can come at any time.

We have NO STATIC to speak of here! I talk to people all the time who are griping about their 20 over 9 static, while my S meter sits on the left side of the pin except when people talk. When we are not in a black hole situation, I can hear stations that no one else in the nationwide group can hear, simply because my noise level is so gloriously low.

In short, you could not get me to leave this place because even with its weird conditions, the fact that the only time I get static is during a local thunderstorm (it hardly rains here either)....

Winter here is just about exactly 6 months long. Almost 6 months of skiing if you are into that (I am not). BUT in the summer, the sun is out til way past 10pm. Almost 11 at summer solstice.

Is there anyone North of me on the net? (Sorry Toronto, and Montreal, you are my neighbors to the SOUTH!). I would like to know how much of this stuff is Aroural, and how much is because of the Permeability of our iron rich ground shelf.

Lets Get Technical!

Right on, Phil! A little more diagnostics wouldn't hurt much. With all
the mixed signal chips, analog interfaces to digital chips and powerful
uPs with cheap memory this would be a welcome improvment over the possible
use of those poor excuses for an S-meter called bar graphs.

I remember the days when rigs had meter switches that did a lot more than
monitor ALC and final current, even the Gonset "Communicators" had meter
(eyes for the earlier ones) switches.

I've been hearing this argument for years, and nobody has ever been able to substantiate it. While I suspect that the phone company would object, it would be no more illegal than using an HF phone patch for the same thing.

A more practical problem in doing what the original poster wanted is privacy - there is none on an autopatch. This, plus the restriction on business calls, makes the usability of an autopatch for routine personal calling pretty low.

2424. Remote mount...

Newsgroup: rec.ham-radio
Date: 1990-04-25 13:09:00 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <25.Apr.90.14
Source record: 12024

Remote-mounted radios are a great idea. I have used a considerable
range of such radios in the past, i see the advantages to be:

1) Easier to instal in modern automobiles. The control head can often go in
place of the normal broadcast radio - but the hole is rarely deep enough to
fit a full-size ham radio in, without redesigning the instrument panel
or moving the heater/airconditioning. So stick the signal unit in the trunk
where its nice and spacious, and run a control cable to the trunk.
Thats the *only* way you can do it with some gear (I used to run a 'PYE
Vanguard' - a 18" by 12" by 9" 100-watt TUBE mobile rig on 2 meters...
it just would not fit anywhere except the trunk!)

2) More secure: If some jerk breaks into your car to steal the radios,
he more than likely just gets the control head.
You can always buy (or build - theres only a couple of pots and channel
change switches and high/low buttons) another, at less than the cost of
a new radio.

3) Safer: No bulky radio on the transmission hump, for you to smash your
knees agains if you have a wreck.. No 50-amp power feeds hanging about to
get caught round the gearshift...

4) Neater: Fewer wires trailing about (if you do the installation
properly, that is). Less equipment to climb over when trying to get
into the rear seats of a two-door car (important if you have to carry
children or non radio-literates who trample over your gear!)

5) Better for the radios: The trunk is usually cooler and better
ventilated than the instrument panel. With good air circulation, your
heatsinks will run cooler and the radio will last longer..

With some modern smaller radios, the signal unit could possibly be
installed under the seat rather than in the trunk.
I think one of the ICOM ranges uses an optic-fibre to link the head to
the radios (several 'band modules', one control-head!)

> ...
> Andy Greenshields [dxandy@widener.BITNET]

Andy asks for a mail response this request. However, since this
question comes about once a month and BITNET mail generally fails for me,
I'll post a general response here.

First, to the net in general: when asking questions, GIVE A PHONE NUMBER.
Not all the readers of this group are students who can't afford to make long
distance phone calls (they or their employers can afford it that is). There
have been numerous questions asked that I have passed up answering because
I can't afford to take the time to type out a response. This is specially
so in answering technical questions, where there are many responses and the
person asking did not give enough particulars.

Regarding a rig to choose: With the exception of the entry level Yaseu (757?),
any new rig would fill the bill. Your best bet is to choose one that is
recommended by a local ham. Find out what is in use in your local area and
talk to local hams. Then make your choice. Go knock on the door of a house
with visible amateur antennas. I did this to three local hams, not one turned
me away, they took a stranger in and each spent several hours talking to me.
I personally prefer ICOM products, but others in this area use Kenwood. The
number of knobs on the pannel does not determine the goodness of the radio.

Antennas: I have spent more money on antennas and towers than I have on
radios. This was good advice given to me and I pass it on to you also. Get a
decent antenna. IF you have never used anything else, a vertical seems not
to bad. However, unless space (or landlord) dictates otherwise get a beam.
Start with a 3 element tribander if you are looking for low bucks. Get one
of the smaller ones and you can put it on a TV mast and turn it with a TV
rotator. Brand new for everything this will cost about $500, good shopping
at flea markets (or the local hams suggested above) will provide this for

$100 or so. My first TH-3jr, mast, rotator, and coax was bought ($75) from a local ham upgrading to a big tower and antenna. I used this and a borrowed rig for a year and then bought my own, used, rig. Until I got into DXing this served me well for 5 years (and 125 countries). A vertical will work for 80/75 and 40 meters, but in the long run you will be unhappy with a vertical on 20/15/10 (to the flamers, yes a vert works now. But in a year or so the sun spots will be down and then the vert just won't be any fun). A small tri-bander or any beam will require a rotator. It will also work better the higher you get it, start with a 2 section 20' TV mast on the roof. This will put the antenna at about 35' which you should look at as a minimum. To this you could add a vertical or wire antennas for 40 and 80/75 meters. 10-15 are daytime bands, 20 daytime & early evening, and 40, 80/75 are night time bands. To fill out your ability to operate all the time you will eventually need to get antennas for the "low" bands. This set up will work fine for lots of years.

Don't forget to budget accessories in your plan. If CW is in your operating plans you will need a key and/or paddles and a keyer. You will need an antenna tuner to get wires and/or the verical to work on all of the low bands. An independent (from the rig) SWR/power meter is nice (but if the rig has one, it may not be absolutely needed). You will also need to get an coax switch for selecting antennas (you WILL have more than one antenna, they are the easiest and cheapest form of experimenting you will do). To keep the rest of the family (neighobors) happy get a set of earphones, they also make it easier to contact weak stations. You will need coax (DO NOT skimp here), rotator wire, a ground rod, and some wire to run to the ground. If you don't have tools you will need moderate to heavy soldering iron (gun) and assorted hand tools to put all this stuff together. And finally, get a dummy load for testing and tuning up.

Absolutely the last thing to buy is a linear amplifier. If you have not spent as much on antennas and towers as you have the rig, you are wasting your money.

I recommend you get to know several local hams before you start. They will save you an immense amount of money besides being the first of a group of life time friends. If for no other reason that you can't put up antennas by yourself (or you shouldn't try to by yourself).

Have fun and welcome to the world of amateur radio.

regards, Dave

% 24 GHz systems?
% --Aryeh Weiss (4X/KA1PB)

A better person to answer this would be Tom Hill wa3rmx, because he's already got working equipment on 47 GHz. However, I don't think the techniques and methods necessary between 24 GHz and 240 GHz are a whole bunch different than between 2.3 GHz and 24 GHz. Parts are a whole lot more difficult to find, and they are of course a whole lot smaller.

If you're thinking about building something in that frequency range, I would probably recommend that you attempt 47 GHz or 76 GHz so that you will be able to procure parts. Good Luck. 73

Well, its time for my semi-regular reminder about the Un-Net.

What is it? It is a time range and a set of frequencies, sort
of a place to meet.

When? "Every" saturday from 1700Z to at least 1800Z, usually I try
to shoot for 1900Z. (I decided to not move it this year when the
Dumb... er Daylight Savings Time went into effect)

Where? 28.410 MHz and/or 28.390 MHz, or thereabouts.

Who? Net-types. (i.e. YOU :-))

(Yeah, I know, this weekend is Dayton. But for those of us
NOT going to Dayton, let this serve as a reminder/invitation)

73, and don't forget to un-check into the un-net :-) :-)

Rusty

2438. Motorola Bravo Pager info needed

Newsgroup: rec.ham-radio
Date: 1990-04-26 06:36:02 UTC
From: mikey@pnet01.cts.com
Message-ID: <2396@crash.cts.com>
Source record: 12039

Anyone know if the Bravo pager is frequency programable? I also would like to know what goodies are needed to reprogram the cap codes. I would like to have a second display pager on my same "phone number" for my XYL. Any good cheap sources for a pager setup for operation on 931.875 Mhz? My local pager service wants $200.00 to replace a lost/stolen unit. Thanks for any info...

2439. The Black Hole Effect (additional data)

Newsgroup: rec.ham-radio
Date: 1990-04-26 06:36:53 UTC
From: flash@lopez.UUCP
Message-ID: <1990Apr26.063653.1859@lopez.UUCP>
Source record: 12040
Cross-posted to: rec.ham-radio,rec.radio.shortwave

This is a continuation of an article I posted last night. I am writing this right during another BLACK HOLE INCIDENT.

I was talking to KI2J in New Hampshire, as well as other stations along the East. Everyone had strong signals. Freq 3950khz on 75m, 0400z.

Right during one of my transmissions, everything changed. When I turned it back to KI2J, he said that I had gone from 20 over 9 down to an S-7, He was already down to about S-4, and soon I could no longer hear him.

I tried to tell him that I was in the middle of another of the Famous Marquette Michigan Black Hole Events, but communication ceased.

So I decided to check something. I came down to the computer room, and put up GEOCLOCK, which makes a nice world map with a display of the sun and shadow, much like the GREYLINE ADVANTAGE (IMHO, GEOCLOCK IS SUPERIOR because of all the MAPS you can get for it for detailed info).

Now I notice something very interesting. The effect is most pronounced when the sun is exactly on the opposite side of the earth from me. It starts an hour or so before I am at maximum darkness, which tonight occured around 1:14 AM. The event is still occuring now, and I am monitoring the frequency, and I can hear (barely) several stations in conversation, and they certainly are not experiencing this effect at all. It is obviously aroural, though I still suspect that the Ground Permeability is also a factor. Just why NO OTHER station in the group has NO HINT OF THE EFFECT is somewhat interesting. I do not think that Just because I am the furthest north is the only factor. KI2J is at 44 degrees north, right on the New Hampshire border. I am at 47 degrees north. Three degrees should not make such a substantial difference.

The stations I hear on frequency at the moment are all sounding as if they are at the end of a long tunnel, or a leslie organ speaker. Rotating and echoey signals which are barely copyable. BUT they all hear one another just fine.

This is indeed exceedingly weird.

Usually I experience it in the winter, this is the latest into the spring I remember the effect.

Any other Late Night 75m ops to compare notes with???????

Anyone here from, say Finland? I have worked some really great over the pole stuff during these things down in the DX window....

2440. Re: pulse on X-band

Newsgroup: rec.ham-radio
Date: 1990-04-26 07:34:31 UTC
From: die@cpoint.UUCP
Message-ID: <4826@cpoint.UUCP>
Source record: 12041

In article <24281@usc.edu> kjh@pollux.usc.edu (Kenneth J. Hendrickson) writes:
>Sure, we might wind up looking like the telephone companies. Maybe they
>have already tried the pulse idea. On the other hand, I have never
>heard of it.

For what it is worth, I remember reading that one of the very
first operational microwave relay systems, in service late in World War
II or just after, was based on magnetron generated pulses. It time
division multiplexed something like 8 voice channels onto one RF channel by
using pulse position (or pulse delay) modulation. I seem to remember
reading that it was used to establish a telephone link across the Rhine
for use by the US occupation forces. The author of the article I read
considered this to be the first non-experimental use of microwave
technology to relay telephone traffic.

It seems to me that the peak-envelope-power limit now in effect
limits the attractiveness of pulse techniques, since one can no longer legally
fire up that old radar magnetron with 1 megawatt peak envelope power and
radiate hundreds of watts average power in .05% duty cycle pulses with
real PEP wallop.

Aside from the conveniance of using ancient radar technology to
generate high power pulses easily, pulse techniques have little to offer
in performance relative to CW modulations such as FSK, PSK etc. because
the energy in a fast pulse is spread out over a wide bandwidth. A
simple receiver attempting to recover intelligence in a low duty cycle
pulse stream must either have a wide bandwidth relative to the bit
(pulse) rate that lets in a lot of noise, or use a narrower bandwidth
that excludes a significant fraction of the energy contained in the
signal. This is not particularly optimum by comparision with
modulations that concentrate their energy in a narrow bandwidth relative
to the baud rate allowing IF filters to exclude more noise.

2442. New Versions MacIntosh Ham Stacks

Newsgroup: rec.ham-radio
Date: 1990-04-26 12:28:50 UTC
From: dls@genrad.com
Message-ID: <35852@genrad.UUCP>
Source record: 12043

It's been a long time since I last posted anything about these stacks, so I'll refresh your memories about what they are first:

I've created 5 HyperCard MacIntosh Stacks which are helpful for practicing taking the Written tests. There is one stack each for Novice, Technician, General, Advanced, and Amateur Extra written tests. Each stack contains the entire question pool supplied by ARRL and will create a randomly generated test of the correct number of questions (like 30 for Novice) and of the correct number of questions from each section. The tests are interactive and CAN tell you immediately if you get the question wrong, and they will also give you a score afterwards, plus allow you to review the questions that you missed.

I've given away about 50 copies of these stacks already, and they are still available, although now, I must request a Self-Addressed Stamped Envelope, plus blank 800K diskette if you wish me to send a copy (I have no more blank diskettes to give away). Alternately, the Ham Stacks are maintained on a couple of systems via anonymous FTP, although I do not support this. I have no access to any system that allows this. Two places you might look for them are on tank.uchicago.edu, or on Patty Winter's system (don't know the name of the system, Sorry!). They are also available thru a couple of MacIntosh Ham diskette exchanges, one in Austin, Texas, one in Manchester, NH.

I have updated the Novice Stack and the Extra Stack and will be sending them shortly to Patty. The Novice Stack has some minor typos fixed, plus I've added a capability to PRINT the results of the test, for use as official scores. We have in fact used this method for 2 of our last Novice class, when we ran out of written tests. Obviously, this method is not useful for anything other than Novice, since higher classes require that you use Three VEs, so I haven't added this functionality to any of the other Stacks. The Extra Stack has some typos fixed, and a couple of other more major bugs fixed.

Another question that continually pops up is if these files can be ported to a computer other than MacIntoshes. I'm sure they could, especially since HyperCard (or a similar program) is now available on PCs......but I don't have any access to any other computer, so I can't provide anything but 3 1/2" floppy diskettes, used by Macs.

If you wish a copy of these from me, please send SASE and Diskette to:

If you are just looking for replacement resonators for your Hustler antenna, almost every good ham store carries them. Check any of the ads for AES or any other ham outlet and call their 800 number. You'll probably get faster and cheaper response than directly from the factory.

(This is assuming of course, that you just want to buy a new one and not trying for warranty type replacement.)

73,
Michael

You are assuming several things that were not stated. For openers, you are assuming the original report is true. Personally, I tend to doubt it. It just doesn't sound like the sort of thing the responsiblle professionals I have had contct with would do.

Next, you are assuming that the radios were on a primary "hotshot" tactical frequency rather some secondary frequency normally used for non-emergency purposes.

Finally, you are assuming that these volunteers indeed received no training. Again, I tend to doubt those things were passed out willy-nilly.

When I used to live in Thunder Bay, Ontario, Canada, I used to get wierd skip/radio/etc conditions also. As a kid I would listen to the big 89 (890 AM) WLS Chicago very late at night on a transistor radio. In fact Thunder Bay used to get some of its T.V. reception from Marquette, Mich. I recall a program called 'Creature Features' that used to come on at 1 AM, the reception was always pot luck; sometimes you'd get a snowstorm on the screen, sometimes not.

BTW, the calls letters I used to use were VE3-SWC (I believe), which were the call letters of my high school. Try pointing your beam north west (yes, Thunder Bay IS north of you) some time, there are a lot of Hams back home. Best of luck to you!

Regards, David Berezowski

> time delay could mean a 0 bit, and a long delay could mean a 1 bit.

Why is a pulse easily detectable? If you are listening via a narrow time
window IN PROPER SYNC then you will get a S/N advantage. Once syou start
defining addition pulse times to listen on, or widen the period you have
to listen, you lose S/N advantage.

You have to have a wideband system to allow receiving the full peak of the
pulse since its power is distributed in the frequency domain. Of course
if you know the period you can selectively listen to parts of that spectrum
where the signal would be found (a comb filter). Then again, you don't need
pulse to apply that technique.

> No, I don't have a 10 GHz pulse source, but they are available. Now if
> we could only use them legally ...

No one has petitioned the FCC yet.

I am sure they don't use the same frequency that the regular police use,
but rather they use an idle "special events" or "special duty" frequency.

This cannot be, by itself, an important factor. Much of Europe is
north of 47 degrees. I think Bern, Switzerland, is at about 47 degrees.
Even Bolzano, in Northern Italy, must be very close to that.
I lived in Brussels for a while (north of 50 degrees) and never noticed
the kind of phenomena you describe.

I don't know if this is a sign of the times or not....

In Toledo, Ohio, Marko Electronics has gone into bankruptcy. Marko was famous during the period of peak popularity of CB as the leading supplier of illegal amplifiers and the place to take your radios for out-of-band mods.

One school of thought is that the "outlaw" period in CB history is over. The other is that with the easy availability of general coverage modified ham gear in general and the Uniden/RS 10 meter radios in particular there is not enough market to sustain specialized "outlaw" shops.

What do you guys think?

Wanted:-Identification or information on a

Technical Material Corporation Receiver

This was a rack mount (3 rack units(5.25inch)) receiver built for the Navy or Air Force (US). It appears to have been built in the late 50's early 60's era due to the exclusive use of 7/9 pin tubes (no transistors or even germanium diodes). It accepted four plug-in modules to cover the freq range of 2-30mHz. I believe a special adaptor could be attached as a companion for the reception of SSB.

Many thanks. Daniel Blakley

For a limited time, the call sign data base files are online for anonymous FTP access. The host is "vmd.cso.uiuc.edu" (128.174.5.98) and the directory is "phil.514". You MUST use binary/image mode to access the files. They are compressed with UNIX compress. There are 260 files, one for each possible combination of call sign number with letter following it and are named by that method.

Try a J-pole made of twinlead. It's 5' tall, and virtuall disappears if
you use the clear variety. Send e-mail for more info.

If you can hide the matching network, other varieties of end-fed
half-wave antennas work, too.

I have been an RF Design subscriber since high school. For many years
I listed my occupation as student but got it free anyway. Another freebie
is Microwave Journal (685 Canton St., Norwood, MA 02062) but it will only
depress you when you see how far from the state of the art that amateur
microwave is. Commercial microwave, at least up to 30 GHz or so is pretty much
by the numbers: calculate link budget, buy modules, hook them together and
you're done.

There are literally hundreds of these free trade journals out there. I
personally receive at least a dozen in the electronics field. Most (all?)
have "bingo" cards for obtaining free information from manufacturers.

The only FCC reg this might violate is the one on "Good Amateur Practice".
The fear is that if we continually abuse autopatch privileges to avoid
telephone toll charges, this might lead to FCC instituting legal restrictions
(or prohibition) of autopatch use.

From: alanb@hpnmdla.HP.COM
Message-ID: <1250149@hpnmdla.HP.COM>
Source record: 12067

Regarding antenna gain/aperture at 23 cm.

For a given antenna type (dipole, say), the aperture is proportional
to the square of the wavelength. If you have 100 dB of path loss between
two 144 MHz quarter-wave ground planes, you will have 120 dB of path loss
between two 1440 MHz ground planes the same distance apart.

On the other hand, you probably wouldn't use a ground plane at 1440 MHz.
If you built a dish antenna the same approximate size as the 2 meter
ground plane, you might have 20 dB LESS path loss (80 dB total).

If you compare antennas of the same TYPE, lower frequency is better.
If you compare antennas of the same SIZE, higher frequency is better.

Radios/Selling vs. Trading

It has been my experience that you GAIN by selling outright rather
than trading. The dealer --as you well understand-- makes a profit
when your trade is resold. I was once offered $150 for the FRG-7
on a trade. In just a few days I was able to sell the FRG for $250.

Well, does Houghton/Hancock count? (For those who don't know The towns of Houghton and Hancock are about 120 miles west of Marquette). I went to school at Mich. Tech. Univ. until 1983. You are right about some of the wierd local phenomena that occurs. It was the only place where I saw Northern Lights with distinct colors. Canadian TV from across the lake is crystal clear (with a roof antenna), but the Marquette repeater 30 miles away was nothing but snow. Wisconsin TV stations about the same distance as Canada and across the lake but in another direction where usually hopeless, but would sometimes come in crystal clear. I had a roommate who like to listen to late night AM broadcasts on a pocket radio. He used to get great reception of Boston (WXYZ, I believe) and some New York City stations, as well as the occasional Bermuda or Texas station. All from a generic pocket radio.

By the way, why the reference to Finland? Don't you speak the language by now? I thought that Marquette was the only WWUP-TV station was the only television that broadcasts finish language shows on a weekly basis. I have a net.pen pal that lives in Finland, if you want I can send you his net.address.

Well first of all 47 Degrees is not all that far North. It is about
the same latitude as Nantes France. It is south of London, Berlin,
Copenhagen, Warsaw, Den Hague (That's enough dreary capitals -Ed). But
the question I suppose should really be, how far North is it from the
"Magnetic Equator." I dimly recall that a stations position relative
to the magnetic equator is important vis-a-vis Aurora and HF
propagation.

But first, lets assume that Marquette is in Aurora Country and is
also sitting on top of a fair amount of iron ore. There is a similar
location in Sweden. The world's "largest city" (in square kilometers
of desolate Tundra) is Kiruna. It is also an enormous iron mine. Hams
there should experience the same phenomenon as Gary.

I remember in the seventies hearing a second hand story that DX was
pretty bad off the Southern Tip of Sweden (Ystad, Trelleborg) because
there were massive Iron deposits just offshore. The story involved not
getting out and not hearing too well. Southern Sweden does get a few
Auroras also.

No good answers I'm afraid, but certainly some points of reference and
comparison. All we need now is a report from Kiruna.

Note: Marquette is about 47 degs North, Helsinki - 60 degs North and
Kiruna - 68 degs North.

>Why is a pulse easily detectable?

Because it has such a high peak power.

>Once syou start defining addition pulse times to listen on, or widen
>the period you have to listen, you lose S/N advantage.

I disagree. Since the pulse is of such high power, a much greater path loss can be overcome. Listen 100% of the time, and the strong pulses that are much greater than the background noise level will be easily detectable.

Organization: University of York, Dept. of Computer Science
Subject: PRO-57

In a recent article, fluke!limey (Paul Limey KW7Y) asked:

> Does anyone have mods to the Realistic PRO-57 to fill
> in the missing frequencies? Does anyone have a schematic for
> same?

This is perhaps not exactly what Paul Limey was asking for, but:

I have successfully modified a PRO-57 for computer control. The modification entails the addition of one chip (a multiplexer), a few resistors, and a diode, all of which fit on a small piece of Veroboard inside the box. The receiver is connected, via a 9-way plug & socket & ribbon cable, to a separate interface box, from where an RS-232 link goes to the controlling computer (a Sun 3/50 workstation). The mod. is designed so that the PRO-57 can be used as normal (i.e. without the computer) when the interface box is not plugged in.

Details on request.

This is not true! Distances greater than this have been worked on all
bands up to and including 23 cm. I don't know the current world
distance records above 23 cm, so distances greater than this may have
been accomplished on the higher bands also.

Don't be fooled. There is a LOT of difference between setting a distance
record and having fairly predictable and reliable communication. With a
kilowatt, and BIG ham antennas, you might expect 600 km or a bit more on VHF
bands by tropo scatter. On six meters, people consistently work 2000 km by
ionospheric scatter, again with a kilowatt and big antennas. But the distance
cut-off is pretty sharp, since it is a lower-E-layer phenomenon and both ends
of the link must be able to see a common point in the E layer. Iono scatter
works better on ten, but hardly anyone uses it since other modes are enough
to keep them interested.

No, you'll have to use the HF bands, and even ten is marginal from here
(Washington DC) to Texas on many days.

I attribute the change of interference level with picture brightness to a change in the BEAM CURRENT of the CRT. Thus the HV lead may well radiate, though the picture-tube-cone capacitance might help reduce this a lot. I certainly hear my computer a lot louder when the screen is full of text rather than just a simple C> in the upper left corner.

Just a thought.

Mininec2 does indeed live on WSMR-SIMTEL20. You can find it in:

PD1:<MSDOS.HAMRADIO>MININEC3.ARC

It is 158,720 bytes long. However! The request was for a source of NEC,
which is the grandfather as it were of mininec.

Mininec is, to say the least, user hostile. It is also written in BASIC.
NEC, was written in FORTRAN.

If you want mininec3, you might try anonymous FTP. I have never had any
luck--either loose the link, or am told "too many annonymous users" and
get blown away. So, I use listserv(e). To make good use of this, you need
to be able to uudecode files. To get mininec3, I would type:

Mail listserv@vm1.nodak.edu (there are other servers around)
SUBJECT: (Leave Blank)
(Text Here) /pdget mail pd1:<msdos.hamradio>mininec3.arc uuencode

This gets the file mininec3.arc sent to me as pseudo ASCCI email in about
40k chunks. To get a useful file, I needed to combine all of these mail
chunks--eight or nine of them, as I recall, remove the mail header and
trailers--creating a bodacious mininec3.uue file--then move this to my PC.
I then run the uudecode program--mininec3.uue goes in, mininec3.arc comes
out. Run your favorite unarcing program to get the run files.

This works fine for those of us using ms-dos machines. Anyone out there
want to give access directions for other (non-MS-DOS) partitions on SIMTEL20?

Message-ID: <2657@violet29.UUCP>
Source record: 12102
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Does anyone have information about the fate of Teletext services in the US?
This is an information service that provides text and block color graphics
capability on a home TV receiver equipped with a special decoder. The data
is embedded in several unused TV lines in the vertical blanking interval.
The data repeats over and over in the form of a magazine. The decoder
simply grabs pages as they come by and stores them in a display buffer.
The system is very popular in the UK.

Zenith used to offer an embedded decoder on some of their sets. Also, Dick
Smith electronics offered a kit a few years back.

Observations on several local broadcast and cable channels show considerable
activity in the blanking interval.

Information on current status of Teletext and sources for decoders would
be appreciated.

Well it is nice to hear from someone up there. I was in Houghton which is a few 'minutes' in latitude higher than Marquette. The joke around town is a postcard with a picture of a snow covered road and a signpost that reads something like "Houghton 5 miles, End of the World (Earth) 12 miles".

However, with regard to the original question, I did not notice any such problems with reception in the Keeweenaw Peninsula of the Copper Country although there were substantial iron and copper ore deposits in that region. The AM bands were quite decent with MW stations from Louisana and Massachussetts coming in quite well. The HAM bands were also quite normal compared to what I get here in Texas now.

"Houghton 250" snow average/year and 6-7 months of snow on the ground!"

This is my second attempt at posting this, excuse me if you saw this before.

I believe pulse has no inherent signal-to-noise advantage over narrowband techniques. Yes, the peak power is much higher, but so is the bandwidth. Since noise is proportional to bandwidth, it comes out a wash.

The advantage of pulse at microwave frequencies is that frequency stability is much less important than with narrowband modes. Stability is harder to achieve the higher you go in frequency.

Once again, Morse code spacing:

Dit : 1 unit
Dah : 3 units
Space between dit's/dah's : 3 units
Space between words : 7 units

Note that the word "PARIS", including the 7-unit space at the end, is
exactly 1 standard "word" long.

Time for me to make my semi-regular announcement :-)

Anyone needing something like the above, I've got about 3 different versions of morse code programs. (The list is at home, so I don't know exactly which ones they are, sorry)

In any case, I'll glady copy the ones I can legally send onto a disk, if you will send me the disk, return postage, and a return address label. Oh, yes, I'll mail it back to you, too :-)

I can write 1.2 meg, 1.4 meg, 720k, and 360k disks. Please send PREFORMATTED disks.

Hope this helps!

Well, that sounds vaguely like something I once said but I can't remember
either.
Be careful about terms here since there is a popular misconception about
pathloss that goes something like "something magical and dreadful happens above
1 GHz or so and energy is no longer conserved which is what accounts for
microwaves not being good for anything". Efficiency sometimes gets used to
relate to the subject of how much of the transmitted power going in at
the connector actually gets turned into useful radiated energy. Lossy elements
within the antenna structure or local environment(ground losses etc) decrease
this. People also talk about "aperture efficency" which relates to how good a
job an antenna does (on receive) of "catching" all the incident power from
some distant source or (on transmit) of creating local fields which all
contribute to the production of the theoretical maximum fields at a distant
measurement location.
Although skin effect or other losses may not scale with frequency there is
no general *frequency* term related to the inherent ability of an antenna
to translate transmitter power to radiated fields. There is nothing fundamental
preventing a dipole (or any antenna of constant *electrical* description for
that matter) from generating the same farfield power at 10 GHz as at 100 MHz.
1 watt into a an isotropic antenna spreads out to become the same intensity
on the surface of the encompassing sphere of radius D(istance). Adding up all
the power over the surface of that sphere gets you back to the original power
you put into the antenna (minus any that got lost heating up the copper,
dandilions or whatever).

Al N1AL writes:
>
> On the other hand, you probably wouldn't use a ground plane at 1440 MHz.
> If you built a dish antenna the same approximate size as the 2 meter
> ground plane, you might have 20 dB LESS path loss (80 dB total).
>
> If you compare antennas of the same TYPE, lower frequency is better.

> If you compare antennas of the same SIZE, higher frequency is better.

Al correctly identifies the rub: The *physical* size of an antenna of given *electrical* description is decreasing with frequency. That is, the *physical* aperture (how big a "flux catching bucket" the antenna represents) of an antenna is changing at -20*log(freq). This means that if you compare the end to end performance on a freespace path using constant electrical size, say two dipoles or two isotropic antennas, it looks like there is indeed some kind of "pathloss". However, energy is conserved (I know we are all breathing easier now) and what is really happening is that the receive antenna physical aperture is shrinking with frequency. Consequently if you go out a constant physical distance from the transmitter and see how much you catch you discover lower frequencies appear to work better. Don't believe that! It's just that your antennas are getting smaller. Or put another way, you went a greater *electrical* distance at higher frequencies.

To further compound the misconception, the physical aperture of electrically small antennas (dipoles and other low gain structures) can be much greater than their physical size. This accounts for pocket transitor radios with loopsticks working as well as they do. Although they are physically small they electrically have virtually the same aperture (bucket size) as a dipole, I forget the difference but it is fractions of a dB or so. They may be miserable to feed due to their extremely high Q and resultant inefficiency given real world matching networks (160 Meter mobile antenna problem) but they do a fine job to the degree that one can couple to their radiation resistance. This situation furthers the myth that low frequencies are better; physically small antennas don't seem to be the same. A rubber ducky on 10 Meters (do they exist?) appears to work better than the same length full size monopole on some much higher frequency.

Once one gets away from the somewhat confusing lowgain/simple antenna situation things do become more obvious. For a constant ERP (constant tx power into constant gain antenna) you get constant flux at distant receiver site independent of frequency. Putting up a constant physical size receive antenna results in recovering the same power, independent of frequency. However that receive antenna's directivity and gain (directivity~gain if there isn't some frequency dependent loss problem) is increasing with frequency. Therefore for the constant *electrical* size transmit antenna (dipole, 5 element yagi, 100 lambda diameter dish or whatever) and constant *physical* receive antenna size there is constant "pathloss", "pathloss" in quotes because no energy is really lost on the path itself. No frequency dependency or deterioration would be noted.

But wait! We aren't done yet. The real world often(usually?) has us use the same antenna for transmit as for receive. If we let *both* ends be constant physical size (actually constant physical aperture but I'm talking about higher gain antennas so the two are roughly the same now) our ERP is increasing with frequency along with the gain (or electrical aperture) and we are increasing the flux at the distant receive "bucket". Since electrical aperture goes as lambda^2 this is a +20*log(frequency) dependency.

This makes higher frequencies look *better*, as Al mentioned. A given physical size antenna focusses the transmitter power better on the distant receive

site as frequency is increased. We end up wasting less of it in directions
where we are not collecting/receiving it (for point to point communications).

Summary:

Constant electrical size on both ends (as in omni-omni links) gives
-20*log(frequency) performance. Things get worse with increasing
frequency. In addition physically short antennas can (nearly) behave
as though they were full size dipoles exagerating the perceived effect.

constant electrical/constant physical size antennas on a link has no frequency
dependency. The transmitter creates constant flux/meter^2 and the constant
physical size receive antenna catches the same amount, independent of
frequency. This might be an omni/directional antenna link.

Constant physical size on both ends (directional/gain antennas on a full
pt-pt link) gives +20*log(frequency) performance.
Higher frequencies allow focussing more of the absolute
transmitter power on the remote receive antenna as frequency is increased.
This effect continues until real world constraints like water vapor absorption
or beam de-steering by troposhperic conditions diminish it.

This is the crux of the argument for going to a network of point-point
physical layer links as we try to build a moderate/high speed amateur
digital network. Not only do we have to use higher frequencies to efficiently
transmit our bits, we have to go higher to find spectrum in which to do it.
Both of these reasons are vital as we try to provide high bandwidth
information (high rate, low latency and high volume) simultaneously to a
large number of users.
The physics, economics and politics of the situation all demand this.

Just locate the nearest Radio Shack store and I'm sure the salesman could explain the advantages and operating procedures. Generally, they are not very expensive; 50 to 150 dollars. I believe a good one could be purchased for $70. The antenna will run another 20 to 30 dollars. I would suggest just getting a "magnetic mount" type that will stick to the surface of the trunk lid or roof and run the coax cable in through either the trunk or through the window.

Best of luck

> >Why is a pulse easily detectable?
>
> Because it has such a high peak power.

...yeah, ...if the way you are listening happens to be peak sensitive. A "peak" can also exist in many other forms (domains) such as spectral (i.e. an unmodulated or low baud rate CW carrier). What you are talking about is concentration in the time domain only. There are other domains from the simple spectrum domain, to more complex domains involving spread spectrum.

Regardless of where you put the signal, provided you put it somewhere that it can be picked up, you only have so much signal compared to a certain amount of noise. OLDER technology allowed "filtering" out noise in the TIME domain rather easily by closing the receiver at times the pulse is not expected. Today, we can do this in virtually ALL imaginable domains. Shannon's law applies to them all. Pulse just happens to be cheaper using older technologies.

> >Once syou start defining addition pulse times to listen on, or widen
> >the period you have to listen, you lose S/N advantage.
>
> I disagree. Since the pulse is of such high power, a much greater path
> loss can be overcome. Listen 100% of the time, and the strong pulses
> that are much greater than the background noise level will be easily
> detectable.

You can overcome the same path loss by many methods. Suppose your system is marginally working, and the path loss increases by 3 db. You could increase the POWER by 3db and overcome it. You could DECREASE THE BAUD rate to 1/2 and overcome it (changes needed at the receiver to narrow the bandpass to gain the advantage). Other methods can be used in other domains.

We are talking about theory and practicality. The ONLY advantage I see to pulse is that much pulse equipment is available to hams cheaply. It is not inherintly better in terms of noise immunity. Given than hams are limited to a peak of 1500 watts, pulse has a DISadvantage of actually REDUCING your average power. Of course that disadvantage might be gained back if you are trying to drive the signal through an amplifier that can handle only an AVERAGE of 15 watts for dissapation purposes for your 1% pulse.

Pulse has practical advantages in certain cases, but it has NO THEORETICAL advantage.

This might apply to receiver and not transmitter. I'll have to think
about it for some time (and consult with KE9TV) to be sure I have all
the variables considered.

I suspect that if you scale down the whole system, transmitter, receiver,
wavelength, AND THE PATH LENGTH, you would have a constant signal strength
or perhaps a constan S/N. Of course reality does not allow us to scale
everything any way we want, such as path length.

>This might apply to receiver and not transmitter.

This applies to a system including transmitter, receiver, and similar antennas at both ends. As frequency is changed, receiver noise figure, transmitter power, and path length should not change.

>I suspect that if you scale down the whole system, transmitter, receiver,
>wavelength, AND THE PATH LENGTH, you would have a constant signal strength
>or perhaps a constan S/N. Of course reality does not allow us to scale
>everything any way we want, such as path length.

This is not true. As the antennas stay the same size, antenna SYSTEM gain goes up as f^4 (because the antennas at each end have gain that goes up as f^2) but the path loss only goes down as f^3. Thus, for antennas of the same size, there is an advantage to going to higher frequencies.

For antennas of the same type, lower frequency is better for two reasons. (1) the antennas get physically larger, and (2) for higher frequencies, the antennas get very difficult to build. Just try to build a yagi on 3 cm!

I don't remember anything in the original posting that said the requestor was trying to beat the toll charges. It just so happens that the person who sent the original request is a Midshipman at the Naval Academy, and he is not likely to have a phone in his room nor can he run out and look for an available phone booth any time he wants. Being as running phone patches for the military, especially ships at sea, is something hams have always bragged about, I can't understand why everyone is up in arms about this poor guys request.

And just as a matter of information, I once knew of a repeater that was set up primarily as a means of avoiding toll charges. It was set up in a location where it could have a phone number that was in an exchange that would normally be a toll call for the group who comprised the regular users of the repeater. I don't know of anyone ever getting a pink slip for using it.

Message-ID: <33977@sequent.UUCP>
Source record: 12107
Cross-posted to: rec.ham-radio,sci.electronics

One way to implement the audio phase difference for the phasing method of SSB generation is described in _The_ARRL_Handbook_ and in Horowitz and Hill's _The_Art_of_Electronics_ 2nd ed. page 295. They call it a phase-sequence filter and it consists of a cyclic network of resistors and capacitors, driven by two signals of 180 degree phase difference, producing four outputs 90 degrees apart. Does anyone here have any experience with these filters? In particular, how are they designed and analyzed? References?

Thanks,
Bob Kelley

But can you explain why the case I cited is incorrect as you say without
giving as an example some entirely different case? I was not talking
about the case of antennas of the same size.

As the antenna scales with wavelength, it's gain is constant. The path
length is also scaled meaning the path loss is less by f^2 but the
receive aperture is less also by f^2. Still seems constant to me.

Does anyone out there have the stats for the new IC-970?
I just saw an add, but it wasn't very complete. Does anyone know
the power specs etc...and has anyone ever used one??Or is it still too
relativly new.

Also, has anyone out there got an IC2400? If so, how good are they in
the practical world?

Dave

From: s54@H.CC.PURDUE.EDU
Message-ID: <9004282238.AA27773@h.cc.purdue.edu>
Source record: 12116

Hello!

I am building a power inverter (12v DC to 120v AC) that I hope to eventually transform into a UPS for a computer... The schematic was obtained from Motorola and uses 2 MTM60N06 power TFETs in the output stage. It uses a Xtal controlled frequency source and outputs a very nice high power 12v sine wave. The part I need help with is finding the transformer. I need a 120v to 12v 40amp center tapped transformer. I have had no luck whatsoever in finding one. If anyone could point me to a source of such a beast, (preferably surplus :)) I would appreciate the info. I dont even know how much the thing should cost.

Thanx.

P.S. These accts will only be mine until May 9.

Re: Mag Article Wanted - VHF COMM 3/82

Wanted:

I am looking for a copy of the magazine article listed below:

Extremely Long Yagi Antennas
by Gunter Hock DL6WU
in VHF Communications Magazine (German magazine) 3/82

******* Attention VHF/UHF Operators *******

Appreciate any help. I have seen this article referred to many times
by VHF/UHF antenna design software programs. I'd like to verify some
of these programs. Actually, I have two different programs for designing
DL6WU yagi's and both programs give me slightly different results. So I'd like
to go to the source to see which one I should trust.

Thanks es 73's.

=========
SpaceNews
=========

MONDAY APRIL 30, 1990

SpaceNews is published and distributed weekly around the world on USENET
and Amateur Packet Radio. It is available for unlimited distribution.

* STS-31 NEWS *
===============
Mike (WD8KPZ) of Phoenix, Arizona reported hearing space shuttle astronaut
communications on a frequency of 279.000 MHz AM during their EVA during the
deployment of the Hubble Space Telescope.

Mike used an Icom R-7000 receiver and a quarter-wave ground plane antenna at
an altitude of 15 feet to receive the astronauts.

* STS-35 NEWS *
===============
The STS-35 Astro-1/SAREX mission launch date has been delayed from May 9 to
May 15 due to the STS-31 launch delay. There may be a further delay due to
a presently unhealthy STS-35 astronaut.

* DOVE-1 NEWS *
===============
Bob (N4HY) continues to upload software to the DOVE-1 satellite in an effort
to bring it back "on line" after the OBC crash last month. DOVE-1 is
presently transmitting on 2401.100 MHz (+/- Doppler!) while the 145.825 MHz
general beacon is turned off. DOVE-1 will be back on VHF in a short while
carrying digitized voice messages of world peace.

* COMET AUSTIN NEWS *
====================
Comet Austin (1989c1) has been sighted by many living on the west coast of the
United States in recent weeks. Comments from observers indicate that the comet
was not as spectacular as expected and there are indications that the comet's
brillance will decrease further now that it is receding from the sun.

* CONSORT-3 LAUNCH *
====================
The launch of Consort 3, a commercial suborbital rocket carrying 12
microgravity experiments, has been set for May 17 at 10:40 AM EDT (1440 UTC),
by the University of Alabama-Huntsville's (UAH) Consortium for Materials

Development in Space (CMDS), a NASA Center for the Commerical Development of Space (CCDS).

Consort 3 will be launched from the Naval Ordnance Missile Test Station facilities at the U.S. Army's White Sands Missile Range (WSMR), New Mexico, by Space Services, Inc., Houston, using its Starfire rocket. The rocket will carry the payload to an altitude of 200 miles and will provide the experiments with 7 to 8 minutes of microgravity time.

[From: Peter E. Yee @ NASA Ames Research Center, Moffett Field, CA.]

* MIR NEWS *
============
After numerous postponments, the 20 ton "Kristall" Mir expansion module is expected to dock with Mir on June 1, 1990. Software problems on board Mir are responsible for the delay. The module was orginally scheduled for launch in February. Cosmonauts Anatoly Solovyov and Alexander Baladin have been living on the Mir space station for 77 days.

* SPACE FOR PEACE *
==================
The European Space Agency and the Soviet Union have signed a ten-year agreement to cooperate on exploration and use of space for "peaceful purposes". Space Fax Daily reports the agreement was signed on April 23rd in Paris. There will be no exchange of funds under the pact which has the option to be renewed for an additional decade.

I am looking for manuals, or a good source for manuals for a couple of 40s era shortwave radios. if you know of one.
please reply by e-mal

Thanks

2511. Aiming Antennas

Newsgroup: rec.ham-radio
Date: 1990-04-29 04:09:36 UTC
From: scotto@crash.cts.com
Message-ID: <2443@crash.cts.com>
Source record: 12114

Our radio club is contemplating another remote receiver for our 220 repeater system. Our main intention is to compliment the main repeater (located about 50 miles inland at 5900') for coastal North/South freeway users.

Our original idea was to use a Ringo Ranger II or a Hustler G7, but since inland coverage is not necessary (and the oceans is to the west) we were wondering about two beams pointed South & North-West (the directions of the freeway from the new receiver site)

A 7-element end-mount beam provides approximately 11db gain while the omni's are 7-9db. The other factor is cost. The 7-element beam is $47.00 and the omni's are (depending on model) ~90-150. So, that leaves me with the following questions:

How would two antennas be connected?

Would they do any better than the single omni?

What would *you* do?

Thanks in advance. Direct replies as you feel appropriate. (that means e-mail OR post)

P.S. I'm sorry if this message, PURE in Ham-Radio content, offends any readers! :-)

I would add that the Satellite Receiver is located in Sandy Eggo county and that the coverage area to be enhanced is the Interstate 5 freeway corridor from approximately 20 south of the receiver to 30+ miles north northwest of the receiver. Omni coverage is not needed and in fact would basicly duplicate existing coverage. This I5 corridor is riddled with low-lying coastal hills just west of the freeway and is a major shadow to the repeater site 30 miles east. Hence the desire to fill in the noisy I5 area....Mike

This article, and the next one, describe some pretty classic auroral
sky-wave effects. The last episode you mention came during a minor
storm period. The time of night (strongest when the sun is directly
opposite you) is auroral oval stuff all the way. If you can get
anyone who studies geomagnetism interested, you could try correlating
your data with stuff like aa indices, substorms, bays etc etc.

The ground-wave effects are outside my expertise. All I can suggest
is to grab an FAA aeronautical chart and see if any magnetic anomalies
are noted for your area.

There's a place in Santa Monica, CA where posts move by themselves and
KXLU suddenly goes away (despite being in the 100 dB contour). Local
mysteries are great fun.

You would get very good coverage with a pair of beams, but your coverage
to the east would be very limited due to the directionality of the beams.
7 element beams would have a relatively tight pattern.

If I were in your shoes, I'd think about using stacked folded dipoles.
You can customize the directionality of the system by locating them in
various places around the mast. You could get a pretty nice north-south
pattern and yet still have decent coverage to the east if they are
properly set up.

If you decide to go with a true omni, I'd suggest the G7 over the Ringo Ranger
II. The Ringo is an OK antenna, but I've seen a number of tests that
depict the antenna as having a relatively high radiation angle. The G7
is quite a nice antenna for the money and is one of the few good 220
omnis that you will find. I think you can plan to spend a bit over
$100 for the G7. The folded dipoles mentioned above probably go for
a bit less than that. Makers of folded dipoles include Antenna Specialists,
Phelps Dodge, and a few other commercial makers, although I'm not too
sure how many of them carry 'em for 220.

ZCZC AP21
PROPAGATION FORECAST BULLETIN 17 ARLP017
FROM ED TILTON, W1HDQ
SPRING HILL FL APRIL 23, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX TREND HAS BEEN DOWNWARD SINCE THE MIDDLE OF JUNE
1989, WHEN IT PEAKED AT 327. SEPTEMBER HAD FIVE DAYS OVER 300, BUT
NONE HIGHER THAN 305. IT WAS THOUGHT THAT HIGHER READINGS MIGHT
COME IN 1990, BUT THE FLUX HIGH OF THE YEAR SO FAR IS ONLY 265, AND
THAT CAME BACK IN JANUARY. THE NEXT BEST MONTHLY HIGH, 249, CAME ON
APRIL 20. A SUDDEN OUTBURST OF HIGHER FLUX LEVELS CANNOT BE RULED
OUT YET, BUT CONSISTANTLY MUCH LOWER FLUX FIGURES IN 1990 SO FAR
MAKE THIS A REMOTE CHANCE.

THE FLUX MADE A DRAMATIC CLIMB BEGINNING ON APRIL 9, BUT THE
BEHAVIOR OF THE EARTHS MAGNETIC FIELD WAS A MORE INTERESTING BUT
FRUSTRATING ASPECT OF THE MONTHS PROPATGATION THUS FAR. THE FLUX
ROSE FROM 144 UP TO 249 IN ONLY 11 DAYS, BUT WHAT HAPPENED ALONG THE
WAY IS OF GREATER INTEREST. ON THE 9TH, THE K INDEX ROSE FROM TWO
TO FIVE. OVER THE NEXT SIX DAYS IT WAS NEVER BELOW THREE, AND MUCH
OF THE TIME IT WAS SIX OR SEVEN. SUCH FIGURES MADE FOR ALMOST NO
USEFUL PROPAGATION ON HIGH LATITUDE PATHS FOR THE BETTER PART OF A
WEEK, EVEN AT THE AUTHORS FLORIDA LOCATION.

THINGS STARTED TO IMPROVE AFTER THE 20TH, BUT REALLY GOOD SIGNALS
FROM PLACES LIKE NORTHERN EUROPE ARE STILL RARE. THE SOLAR FLUX IS
HEADED DOWNWARD AGAIN, SO THE REST OF APRIL SHOULD BE BETTER FOR
HIGH LATITUDE PROPAGATION.

AMERICAN SUNSPOT NUMBERS FOR APRIL 12 THROUGH 18 WERE BETWEEN 88 AND
226 WITH A MEAN OF 159.4. AR

HAM RADIO HISTORY

4 Billion BC - Earth is a swirling ball of flaming gases. Propagation is extremely poor.

1 Billion BC - First dry land appears. It is divided up into squares. County Hunters Club formed.

500 Million BC - Second patch of dry land appears. First DXpedition. Credit disallowed because of questionable licensing agreement.

400 Million BC - Flowering plants and grasses evolve. Telrex invents first beam antenna but sales area slow because of lack of suitable structures.

300 Million BC - First tree appears. It is immediately cut down, stripped of branches, placed in a concrete base and named a telephone pole. Telrex sells first beam.

200 Million BC - Second beam sold by Telrex. Installer falls from top of pole. First safety belt sold.

100 Million BC - First mountain appears. Repeater invented.

50 Million BC - It is decided by WARC that "seek you" is too cumbersome to send on CW, so abbreviation "CQ" is adopted.

4 Million BC - Humans replace swine as dominant species. The name "Ham Operator" hangs on, however.

3 Million BC - Dugout canoe invented. Maritime Mobile Net formed on 14.313 mHz.

2 Million BC to 800 AD - Nothing much happens for a long time.

900 AD - Chinese invent gunpowder. BY1AA is first "Big Gun" DXer.

1790 AD - Ben Franklin invents long wire receiving antenna. Ground switch invented.

1961 AD - Second repeater erected. First repeater group refuses to change frequency. First frequency coordinator appointed.

1990 AD - Amateur radio humor sinks to a new low.

On The Subject of QSLing

I would like to present a few points from my side with the hope that the message might get across to those who want so badly to get a QSL from my part of Canada and which can also apply to many other stations in many parts of the world.
{
- I QSL via the bureau when I receive your card and as this is a hobby it may take some time to fill out cards. I also wait until I have enough card ready to make sending them to the bureau worth while.

- I only QSL direct if I am especially interested in receiving your card, I send you an IRC or green stamp, when we have agreed to it in the QSO, when you want my card and send me an IRC or green stamp.

- If you QSL direct without my agreeing to the same and do not send an IRC or green stamp, I will send you a QSL via the bureau.

My reasons for handling QSLs this way is simple and something we should all consider. Ham radio is not (fortunately) only a rich man's (woman's) hobby. I for one am far from being rich and what little money I can spare for the hobby is better put to equipment and keeping the station in operation. At the postal rates in Canada, almost $0.50 to the US and $1.00 to Europe, I could spend $50.00 plus each month when I am active. I can not afford this expense!

US amateurs are the worst on my list for sending QSLs direct with the assumption that I will automatically QSL direct with them. For this reason I (and others) restrict my operations in the US portions of the bands. The QSL issue becomes a big hassle. Explaining my rules for QSLing at times brings nasty comments. Nothing personal, but I need very few US QSL cards. I have a drawer full of them. I can work most parts of the states any time of the day.

After many years of being on the air I no longer have the same interest in collecting cards that others may have. I have a large collection of QSLs from all over the world. In most cases others may want my card much worse then I want theirs. I would be pleased to QSL with anyone who will follow the simple rules, which I feel are basic courtesy to other stations.

73's DE VE5KEN - Ken E. Crowston,
Saskatoon, Saskatchewan, Canada

2521. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-04-30 11:44:23 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9005010704.AA02627@ucbvax.Berkeley.EDU>
Source record: 12123

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

2522. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-04-30 11:44:53 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9005010704.AA02593@ucbvax.Berkeley.EDU>
Source record: 12124

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

>thing about the tower.

I have some old ROHN catalogs (back to 1975) and there is not a single crank-up tower. In fact, there is a flame about how unsafe crank-up towers are and why you should by ROHN instead. This leads me to wonder if your tower is a real ROHN. Does it say "ROHN"? Maybe you would have better luck contacting Hy-gain.

I think that in this particular case the radiation is being supported by the cable system. The same tv with rabbit ears causes no interference. I have added a high pass filter and a 6db attenuator at the tv and another high pass filter at the wall outlet for the cable along with a dc blocking device. This reduced the interference all the way down to extremely annoying.

I suspect that the energy is coupled into the cable rather than being carried by the coax shield (that's what the dc blocker was for - it simply introduces a small break in the shield). The cable company, of course, denies that the problem could be in their system.

As a new ham (2.5 weeks!), I don't yet own the various callbooks and other necessities of DX life. Consequently, I was wondering if anyone out there in netland could help with a few addresses:

DF8WS
EL7X
HB9AQW
K1VV
KB8ANX

If anyone could look these up in a callbook for me, I'd be most appreciative. In fact, DF8WS was my first non-US QSO, so holds some special interest for me. Thanx in advance to anyone who can help out... 73s

2528. Re: Phase-Sequence filters for SSB

Newsgroup: rec.ham-radio
Date: 1990-04-30 15:06:46 UTC
From: commgrp@silver.ucs.indiana.edu
Message-ID: <43565@iuvax.cs.indiana.edu>
Source record: 11935

>One way to implement the audio phase difference for the phasing
>method of SSB generation is described in _The_ARRL_Handbook_ and in
>Horowitz and Hill's _The_Art_of_Electronics_ 2nd ed. page 295. They
>call it a phase-sequence filter and it consists of a cyclic network
>of resistors and capacitors, driven by two signals of 180 degree
>phase difference, producing four outputs 90 degrees apart. Does
>anyone here have any experience with these filters? In particular,
>how are they designed and analyzed? References?
>Thanks,
>Bob Kelley

This device is an all-pass network with constant phase shift
throughout the speech spectrum.

See _QST_ January 1988, p. 16: "A New Breed of Receiver" by Gary A.
Breed, K9AY (who, incidentally, is the editor of _RF Design_
magazine). This article contains the schematic for an active 90-
degree audio phase-shift network using 8 operational amplifiers. The
article also contains an excellent explanation of how the phasing
method eliminates one sideband.

The advantages of the phasing method is that it requires no expensive
RF SSB filter, and is frequency agile. A properly-aligned phasing-
type transmitter is said to have better audio quality because there is
no ringing from a sideband filter.

Disadvantages: The phasing method requires _two _ balanced
modulators, and phase-shift networks for both audio and RF. It has a
higher parts-count, and is more difficult to align. Perhaps it will
become more popular with the advent of inexpensive Direct Digital
Synthesizers (DDS) which can easily produce quadrature RF.

Just wanted to clarify a previous response regarding cellular phones. Cellular phones are NOT scrambled (encrypted); although there are many cell phone salesmen that would like their customers to believe this. Cell phones operate in the ranges 825 to 850 MHz (mobile input channels to the cell site and 870 to 895 MHz (base output channels) from the cell site. A cellular phone might be an acceptable substitute for a CB radio, but only in metropolitan areas (large cities). Most cellular services have agreements among each other which will allow a cell phone under one service (such as Cellular One) to use another service (such as US West Cellular) in areas not served by Cellular One. I don't know what charges are in other parts of the country, but in Colorado Springs, a cell phone may be purchased for 300 to 600 dollars with monthly fees from 15 to 50 dollars per month depending upon the number of calls made.

For general purpose emergency use, I would still recommend the use of CB rather than cellular.

Having complained about sanitation at the Dayton Hamvention in the past, I must say that this year they appeared to have made a major and successful effort to remove trash and maintain the portable outhouses. All in all, I had a fine time in Dayton. Thanks, DARA!

This year I remembered to carry a pedometer. I spent all of Friday and Saturday at the Hamvention, and did the Air Force Museum on Sunday. The weekend total hike was 18.2 mi.

BTW, the AF Museum's newly-acquired SR-71 will be on display in June. (They have had a lookalike YF-12 for several years.)

Subject: Autopatch in Maryland.

Hmmm, I MUST have missed something in the original request. The person asked what are the local repeaters in Maryland operating on any band - i.e., 10M, 2M, 220MHz, 440MHz and the GHz areas. Simple question. Granted that he SHOULD purchase a repeater directory, but what if he doesn't know where to get one, or who to ask ? Is he newly licensed? Did he just purchase his radio, and would like to get on the air, so he could join a local club, and use the repeaters patch?

Where does he say he is trying to bypass the local phone company? Why does anyone use a patch? I rarely use one, and in the last several months, I have only made a single patch home - but it is there just in case.

Face it, 89.234% of all patches could be made by stopping at the phone booth, but we don't.

If I had a repeater guide, I would gladly e-mail the info he requests (oops, is that a copyright problem --- scratch that, it would just cause another 2 months worth of flames).

Replies of the like make me afraid of asking questions, in fear of being labled stupid, or it doesn't belong here, etc.

LIGHTEN UP, WOULD YA!!!

Once again I have decided to improve my CW skills. This time intend to
succeed and to help I would like to get a good PC training program.
I have alredy looked at some and none of them do what I would like. I would
really like a program whereby I can send individual characters at 20 WPM
but spaced at some slower speed. This is how I got to 13 WPM by listening
to the sound of the character, and then increasing the effective WPM.
If anybody knows of such a programe please let me know.
Thanks and 73's

2538. Re: Phase-Sequence filters for SSB

Newsgroup: rec.ham-radio
Date: 1990-04-30 22:09:53 UTC
From: rkarlqu@hpscdc.scd.hp.com
Message-ID: <5490096@hpscdc.scd.hp.com>
Source record: 11948

The big disadvantage of phasing SSB compared to filter type SSB comes to light when you look at carrier suppression. It is extremely difficult to get a mixer with good enough balance to get decent carrier suppression without operating the mixer at such a high level that unacceptable IM distortion is generated. Suppose a mixer has +7 dBm. LO drive and 40 dB. LO-RF leakage (a very good spec, rarely found). The LO will then come out of the RF port at 7-40= -33 dBm. To get 40 dB. third-order IM distortion you need to operate 20 dB. below the third-order IM intercept, which is typically 6 dB. higher than the LO drive, or 7+6= 13 dBm. 20 dB. below this is 13-20= -7 dBm. So you drive the *input* with -7 dBm. and with 6 dB. conversion loss, you get an output of -13 dBm. Since the LO is at -33 dBm., the carrier suppression is only 20 dB. Ham rigs that did better than that either had lousy IM numbers or used amplitude and phase "tweaks" to null out the residual leakage from the mixer, at least at one temperature.
That, in a nutshell, is why you never see phasing rigs anymore, and never did see them in commercial equipment which has to meet tight FCC specs. Phasing SSB is pretty much a ham-only technique at least for transmitters.

In a filter type exciter, an assymetrical filter with a very tight skirt on the carrier side is used to get an additional 20 dB. carrier suppression. Also, any IM generated in the balanced modulator is filtered by the SSB filter so it doesn't upset the FCC, it only causes audio distortion. Another ham-radio-only technique is to used a cheaper symmetrical SSB filter and change sidebands by switching the carrier oscillator crystal to the other side of the filter. These radios can be identified in some cases by the dual dial graticule lines on the front panel spaced 3 kHz. apart. The switched crystal technique usually makes it necessary to have a user operated carrier null pot to get decent carrier suppression.

2540. RTTY Listening Question

Newsgroup: rec.ham-radio
Date: 1990-04-30 23:08:05 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <764@west.West.Sun.COM>
Source record: 11944

Last night I spent a frustrating evening trying to listen in on some various commerical and ship-to-shore rtty traffic on the shortwave bands. I once got some recognizable traffic, but mostly gunk. Even when the stations were S-9plus, still gunk. Is everything encrypted or am I doing something wrong? I'm receiving on LSB, and also use the FSK setting on my TS-440. Ok in the ham bands, no problem there.

I'm using an MFJ 1278 multi-mode data controller, and another irritating aspect of its use is that it does not auto configure to the mode/baud being received. (I understand that the PK-232 does this) For example, the station might be 50, 75, 100 or some other baud and the practice of trial and error with the MFJ baud settings is infuriating.

I'm using MFJ firmware release 2.2 and the OPMODE command does not work either. Can anyone shed some light on these topics?

Thanks in advance,

-fred

Dear friends ---

I will be returning home to Kuala Lumpur, Malaysia, at the end of May. I have been operating N3FLX while in the States. I plan to be active on the OSCARs and Moonbounce from 9M2 land.

If there are any hams out there who would like to dispose of any items that may be useful to me, I will greatly appreciate that. I am looking for items would enable a good satellite and moonbounce (2m and 70cm) stations to be setup. My moonbounce experience was gained at K3CR (Penn State Amateur Radio Club station) and taught by AF1T (2m WAS #100). It is my dream to finally setup a super-duper moonbounce station.

So, if anyone would like to donate any items of interest, please e-mail directly to me or through packet. Until then, 73 and hpe to cu soon.

Ahmad, N3FLX/9M2DX.

>
>The new display strikes me as a bit of a wimp-out, though. It does
>work well in bright sunlight, but has a few drawbacks:

I installed wone of these the other day, and not knowing what to
do with the old display, I (what else...) took it apart to see what
made it tick. (Inquiring minds want to know...).

The old display is actually an LCD also. Unfortunately, Kenwood went
to great lengths to defeat the main strengths of an LCD.

First, I should describe what I found. The LCD display panel is
masked with black everywhere that there is not a display element.
Such that if all elements were turned on, that is, blackened, (no flames
about whether black is "ON" or "OFF" please, I prefer to think of
black as on. OK?) the whole display would be completely black. If
all elements were turned off, that is "clear", then you could see
all of them, but only by looking through them.

Behind this display is a piece of plastic with areas colored in the
color that Kenwood wanted that area of the display to look. Behind
this is a simple "light pipe" -- clear block of plastic with small
"grain of wheat" type light bulbs mounted around the edges.

The LCD elements are used in reverse of the normal LCD display. That
is that an element is made clear when it is to be seen, made black
when it is not intended to be seen.

Normally, an LCD is visible by masking the background light, which
either comes from ambient light during the day or the internal
back lighting at night.

The problem is that the little bulbs used by Kenwood could not
overcome the ambient light during the day, hence...you couldn't
read it. The display wasn't that great at night either because
the colored plastic filter attenuated the light so badly that
the display was quite dim then.

Kenwood had a good idea when they tried to make a colored display
using LCD technology, unfortunately, they appearantly failed to

test the thing outside of a darkend lab. Too bad. A real design SNAFU. I hope someone got chewed out over that one. I know I would if I had done something that dumb.

By the way, I believe that a '721 with the new display, or the new '731 to be a near perfect radio. (All radios have warts, I just hate it when they design a great radio and then put in one fatal flaw...)

PS, the term "WART" is my word for a "MIS-FEATURE".

Yes, a friend an I wrote one that has been widely distributed in Utah and other areas. It has too many features to describe them all, but here are a few:

o Does not require calibration for speeds up to 50+ WPM
o Supports "Farnsworth" method (fast chars with slow spacing)
o Menu driven
o Provides practice in random code groups, plain text, random QSO's, random words, random prosigns etc.
o Many many many many more features...

Contact Jim Raehl, N7KXI (good in the callbook or use the work phone number in my .sig)

The program will soon be distributed by Antennas West (check for ads in the common Ham rags...)

I wrote most of the low-level code in the thing, and believe it to be one of the best programs for the pc around. (Me biased? Naaa...)

I recieve nothing for this, just many warm fuzzies when I can help a prospective ham.

By the way, it is being used by several of the local VE teams for code exams.

73 all!

My wife and I will be taking a cross country car camping trip starting June 17th. I plan to haul a packet rig with me. We have done the 2 meter mobile packet routine in the past and have enjoyed it.

I would appreciate receiving any packet maps of the areas we will be traveling thru. From past experience, you find PBBS's in the strangest places. I would hate to miss one because I didn't have their frequency.

We will be driving down the Alaska Highway, across Canada to Manitoba, and eventually to Washington DC and back home again the same way to Juneau Alaska. We will drive thru British Columbia, Alberta, Saskatchewan, Manitoba, N. Dak, Minn, Iowa, Wisc, Ill, Indiana, Ohio, Penn, MD and West VA.

Send the packet maps to me via packet or BITNET. My addresses are KL7RH@KL7HFI or KL7RH@KL7AW by packet. I can also be reached thru BITNET at JSDCF2@ALASKA.BITNET

Thanks.

Duncan Fowler, KL7RH

I'm wondering if this is really illegal. I think you can get a scanner that will scan in the 800Mhz bands, so it is possible. And ANYTHING in the air is, as far as I know, public property -- including government bands, cellular phones, Radar waves (The major argument in the case against anti-radar detector laws). I believe the Supreme Court decided this awhile ago. Does anybody have any details? If I said I was sure I was right, I'd be a liar, but I'd like to know exactly what the laws say.

Oh, and of course the salesman told you it was impossible and illegal -- he is a salesman, and likely was just as lost as I/we are. :-]

I've heard rumors that there is a 3-year-old that just took AND PASSED
the 5 wpm Morse Code test in Oklahoma. Presumably, this 3-year-old cannot
read, does not know her alphabet yet, cannot write, so is normal in most
respects (how many 3-year-olds do you know that can do Morse Code though?).
The test was taken on a computer.....her father (also a ham :-) taught her
"when you hear di-dah, press this key, the A key". I believe the father is
now trying to figure out how to get her past the Novice Written test, within
the year before the Certificate expires.....

Anyone have any first hand knowledge about this rumor? I'd be interested....
Who said that "not everyone can learn Morse Code" .....:-)

Fred, the pk-232 does not autoconfigure to the mode/baud being recieved. It has what they call a SIAM mode which attempts to decode what is being revieved and lets you know. But in amateur practice, if you are copying RTTY in the amateur bands, you still have to switch baud rates by trial and error to get it right. If you come across an ASCII station, you will have to switch the pk-232 from BAUDOT to ASCII. Although I like my pk-232, I think your MFJ 1278 is probably comparable in functionality.

As far as copying commercial stations goes, try the following. Most non amateur stations do not use 170 hz shift. Have you tried 425 and 850 hz shifts? If not try this first. Many non amateur rtty stations are not using FSK, but rather employ more esoteric modulation schemes.

Try calling Universal Radio (in ohio?) for information. They have lots of literature and products for the rtty enthusiast

I have had similar problems, and hope someone can be of more help than
I can, (I have more additional questions than answers) but...

I use a PK-232, and most of the RTTY traffic I find comes up as
"synchronous" when I run the auto configure signal mode. I therefore
don't think the signal is really scrambled, but rather in a mode which
is not easy for the PK-232 to handle. It would be helpful if someone
could explain how synchronous rtty works. Ie, is the timing information
transmitted over a different frequency?, over the other sideband?, or
do they just rely on very accurate baud rates? I don't know if there
is some other software way of handling the synchronous mode.

As to the possibility of "doing something wrong", two possibilities not
mentioned above, are polarity (or bit) reversal, and audio signal
level. With the PK-232, even if the baud is correct, if the polarity
is reversed, the rtty is not readable. The PK-232 has a convient
reversing function. Switching to the other sideband, and/or fine
tuning (or detuning) the freq might also help. Also, I have found
that the audio level of my Kenwood 2000 is too high (or perhaps has
insuficient rc damping) for the PK-232, such that noise registers as
data, giving "gunk". I have much better results using a supposedly
inferior (Sony ICF5900) receiver, which has a more damped audio
output.

Message-ID: <1250156@hpnmdla.HP.COM>
Source record: 11961

> >I suspect that if you scale down the whole system, transmitter, receiver,
> >wavelength, AND THE PATH LENGTH, you would have a constant signal strength
> >or perhaps a constan S/N. Of course reality does not allow us to scale
> >everything any way we want, such as path length.

This is true. Imagine the following communications path with a narrow-beam transmitting antenna (say a large dish) and a receiving antenna of a certain aperture:

```
. . |
. . |
. . | Receiving
. . | antenna
Transmitting | . | aperture
Antenna | . . |
. . |
. . |
. . |
```

(The dots represent the edge of the transmitted beam.)

If you scale the entire system up by a factor of two (lower the frequency by 2, double the size of both antennas, and double the path length), the above picture doubles in size. The spreading angle of the transmitted beam stays the same, since the antenna gain is the same, but the receiving antenna aperture doubles. The path loss stays the same.

Looking at it another way, if the path length had stayed the same, then for same antenna types, the path loss would go down (improve) by 6 dB with a 2X lowering in frequency. This is cancelled out by the 2X increase in path length.

The same holds if you transmit with the right-hand antenna and receive with the left due to the principle of antenna reciprocity.

Bad news in the Amateur Radio publishing world.... Ham Radio Magazine has been sold to CQ magazine. They acquired all rights to the name., the bookstore and the name "Ham Radio Horrizons". Publication will stop immediately. Current subscribers will have a choice of filling out your subscription with CQ or getting your money back. I think most of the subscribers will do the later. Jim Fisk must be rolling over in his grave. I for one will be sorry to see HR go. I guess all good things must come to an end.

HI Manuals, located somewhere in Iowa (I can't find my copy of their catalog) stocks manuals for just about any receiver/xcvr/transmitter made, and their prices are pretty reasonable. Their ad can be found in the ads of any issue of QST or other such magazines. Good luck.

Deja vu time. Or "This is where I came in, Merv."

Phasing rigs were the first ones I had experience with back in the 50's. The first inexpensive ham SSB rig was the SSB, Jr., described in the GE Ham News, published by the Electron Tube Department of General Electric. This radio was spiffied up a little by Wes Schumm and produced in kit form as the Central Electronics 10A. It had a 6AG7 tube as the Class A output stage and generated approximately 10 watts PEP. C.E. also produced a phasing type receving adapter called the "Signal Slicer". Both employed passive, RC phase shift networks.

To facilitate homebrewing (That was still common back then.) both the Millen Co. and Barker and Williamson made phase shift networks for those who didn't have what it took to match precision component values and trim and measure the results. B&W made a particularly popular one called the "2Q4", which looked like a small metal shell octal base electron tube.

The phasing method had all sorts of advantages but died out because it was difficult with practical passive networks to keep the phase shift error low enough across the entire bandwidth to keep the unwanted sideband suppression above 30 to 35 db. without adding crystal or mechanical filters. Of course, once you start adding the good filters that became available during the late 50's and early 60's, why bother with the phasing section?

It's rather fun to watch over the years as one technology after another is "revisited" as new developments make possible applications of them that weren't possible earlier.

2557. AUTOPATCH ASSOCIATION????

Newsgroup: rec.ham-radio
Date: 1990-05-01 19:29:44 UTC
From: gregm@hpcvra.CV.HP.COM
Message-ID: <5710007@hpcvra.CV.HP.COM>
Source record: 11955

I have a few questions that may quickly be answered by the net.

The local HAM club has recently installed an autopatch on the local university repeater (best repeater for local coverage and availability, etc.). It has been a long haul (1.5yrs) to get all the technical things worked out with the university club supporting the repeater and our club handling the autopatch side.

We have finally decided to open the patch to all users as long as we can get the financial support to pay the phone bills from those who use the patch (the repeater owners never asked for money for the use of the repeater). Our club has paid for the autopatch and the first year's bill in advance and it is up to the university club to maintain the repeater (this was a joint project and everything has worked out well).

In this effort we have felt that maybe we (two clubs) should form some sort of association (non-profit) to handle the money dedicated to patch/repeater support. HOW DO WE DO THAT? Is there anyone out there who has experience in this area? What has to be done for non-profit status? Can we even be considered for non-profit status if the money only goes to supporting the repeater/patch?

There was even talk of incorporating to cover us if somebody decided to sue because something didn't work when it was supposed to (like emergency autopatch). While we all believe there will never be a problem, there is always that chance, and I would like to review all of our options before we resort to closing the patch to only members of the two clubs who financially support our efforts. This would be a shame since our intention was to provide a community service by installing and maintaining the autopatch and improving the repeater.

I would appreciate any and all opinions......

Thanks,

Greg May gregm@hp-pcd.HP.COM

Does anyone know the status of the Japanese Tono Corporation, maker of HAL-like RTTY gear like the Theta-777? I noticed their absence from Dayton and can't remember if they were there last year or not. I have a couple of theories:

1. They are kaput

2. In the wake of declining interest in the States, they are not bothering to go outside Japan.

Frankly, I'd be surprised if they vaporized, considering the lack of suppliers of such equipment in Japan.

I think it has more to do with your distance from the magnetic North
Pole rather than the geographic one. Marquette is pretty close to the
magnetic pole. Here in Fairbanks (65deg) auroral activity is high. Pretty
to watch but bad for HF communications. One period last summer I came back
from a backpacking trip to find HF totally dead. The only thing I could hear
over entire range of 540 KHz to 30 MHz was local BCB stations.

Interestingly, packet on 2m is quite popular around here.

Gene (WA1UXA) informs us:

> Ham Radio Magazine has been sold to CQ magazine ... Publication will stop
> immediately.

This is terrible. I was excited when HR announced that they were revamping their efforts - did you notice their new cover page, "NEW HAM RADIO" - I liked them for coverage you don't find elsewhere. They struck me as a sincere publishing company. Their monthly mail order catalog failed to leave a distinct impression with me, though - I never felt HR was selling products you couldn't get elsewhere.

So I guess now there are basically three ham magazines left in the U.S. - QST, CQ, and 73 - plus some electronics magazines. Is this part of the declining trend of the American amateur radio industry? Magazines rely heavily on advertisement revenue. As the number of manufacturers and retailers diminish, magazines lose money, and as they lose circulation, they drop their advertisement fees, and so the products sell less.

One thing I always marvel at the Japanese domestic market is the intense effort in advertisement and packaging. Sales brochures are much more detailed than the North American versions, and stores are brightly decorated inside and out. "CQ Ham Radio" magazine (the JA version) is one of the top three best-selling monthly magazines in the country, and there are several other ham radio and/or scanning rags as well. I really don't know how they manage. Getting a license there is so much of an hassle.

Which leads me to my perpetual questions that never gets answered:

Here in the U.S., amateur licenses are *so* easy to get (less than five dollars gets you both operator and station licenses? good for ten years? wow), amateur stations are *so* easy to install (you got lots of space - 40m is the second most popular HF band in Japan, but a fullsize 40m dipole is a rare luxury), amateur radio regulations are *so* generous (third-party traffic is illegal in many parts of the world, and in Japan, only JARL can own repeaters). So how come more people don't get in the hobby?

I digress. My main lament today is that I see another passing of a good thing.

I am trying to make a control program work on the R9000. I'm adapting an existing R7000 program that works fine. Everything is working except the read/load memory channels operation. On the R7000, to load a memory you, select the memory, set the freq, set the mode, do a loadmemory command. To read a memory, you select the memory, read the freq, read the mode. On the R9000, only the selection of the channel seems to work. Nothing else is.

Info from ICOM is very sketchy and incomplete. If you know what I need to do or have any ideas, I'd appreciate email.

I strongly recommend the program sold by the ARRL and advertised in QST. It is written by (and also sold by) GGTE. It has the best simulated QSO's of any program I've seen. It does excellent randomization of names, QTHs, occupations, etc. After using it nightly for a couple of months, it was still coming up with stuff I hadn't heard before. It does Farsnworth spacing. I've considered using it to generate tapes for VE exams.

2567. QSL route for AH3C

There is the legal principle of the 'attractive nuisance', but I'll let it ride. I agree that one of the gravest threats to ham radio today is the reflection of the general societal mania for running one's individual rights into the ground to the point that society at large suffers.

Each period in history acquires it's own nickname. The Victorian period, the Edwardian, the Flapper, the Baby Boom, etc. This, I fear, will be the "Me first; f*** you!" Age. Too bad. Among other things it's going to kill off a nice hobby if we're not careful.

2570. WARC DANGEROUS RECORDINGS

I posted recently on another topic and claimed that other administrations besides our would record stupid activity on the ham bands and use this at the upcoming WARC to justify their claim that we do not deserve our allocations. It has already happened. Recently, two European countries, serving notice ;-(sent recordings of the Bouvet operations to the FCC. The FCC sent this to ARRL with a message that went something like `this is your mess, what are you gonna do about it.' This precipitated the highly controversial DX-pedition and contest suggestions/rules etc. that have recently been proposed. We are in real danger in 1992. Land Mobile has before the WARC a proposal to convert all between 1000 and 3000 Mhz to Land Mobile. We had better get our act together and fast.

2572. CQ buys HAM RADIO

Newsgroup: rec.ham-radio
Date: 1990-05-02 17:46:50 UTC
From: rma@mhuxo.ATT.COM
Message-ID: <12049@cbnewsm.ATT.COM>
Source record: 11976

As you may already know, CQ magazine has bought out HAM RADIO. The last issue of HAM RADIO will appear in June 1990. I just spent a while on the phone talking with Skip Tenney(sp?) the owner of HAM RADIO an some of the staff there. Terry Northup and Craig Clark will be staying on in the offices in N.H. What will happen to CQ (will it expand its coverage), whether there will be new periodicals (maybe quarterly) and other subjects are as yet undecided - everything is in a state of flux, as you might expect. The rights to the name HAM RADIO and HAM RADIO BOOKSTORE also go to CQ.

I should declare an interest in HAM RADIO since I was a columnist there, but on a less personal note, I think that HAM RADIO was the only real technical amateur radio journal published in this country and was run by people who were concerned about amateur radio. Its passing is very bad news indeed.

CQ is published by CQ Communications (Dick Ross, who's call I can't remember), which also publishes Modern Electronics and Popular Communications. I can only urge HAM RADIO subscribers and anyone else with views about what constitutes a good amateur radio publication to write to Dick Ross at:

CQ Communications
76 North Broadway
Hicksville
NY 11801

Tell him exactly what in an amateur radio publication will make you keep up or take out a subscription. Subscriptions are what commercial publishing is all about. More readers=higher advertising rates+more revenue=more profit.

What with last year's cut back of QST and now the loss of HAM RADIO the outlook is bleak for those interested in technical aspects of the hobby, and microwaves in particular.

Geoff:

I believe SuperMorse will do just what you've asked for. It as individual settings for CHARACTER SPEED, WORD SPEED, and SENDING SPEED, to that you are in effect adjusting the inter-character and inter-word speeds.

I have used it with classes and to make tapes for individuals and code tests.

The latest version that I know of is 3.09 and it has built in training for new code learners, will send from disk files or the keyboard, will generate random groups or words from a word list, or generate exams.

You can obtain the (shareware) SuperMorse from a number of sources. It is on CompuServe, SimTel20, and many BBS systems around the country. I can send you a copy for trade of a blank diskette, or you can write to the developer directly.

The developer is:
WD5CID, Lee Murrah, 10 Cottage Grove Woods, S.E., Cedar Rapids, IA 52403
*** NOTE: his - suggested Shareware contribution is $15 ***

73, and good luck!

>been sold to CQ magazine.

This is bad, but it is not as bad as it would have been if it had
happened before HR went and watered down the (already skimpy IMHO)
technical content in their articles.

>I for one will be sorry to see HR go.

I also will be sorry to see them go. At least there are some good
technical magazines still available. Dubus from W. Germany for example.
Feedpoint from North Texas Microwave Society.

I think the content of the major American amateur radio magazines
mirrors the sad sorry state of the amateurs in this country. Most hams
are too lazy to get off their butts and build anything, and indeed most
couldn't even if they had the ambition. Of course, there are a few
exceptions, but the condition of the majority spells eventual defeat for
the amateur radio service (IMHO).

The PK232 describes anything as synchronous if it couldn't find obvious start and stop bits in it.

A lot of what you hear as HF RTTY is multiplexed, with more than one data stream being transmitted at the same time. It takes equipment a little bit fancier than the PK-232 to decode that.

I had a great time. The exhibits were first class. I spoke to several designers from Cushcraft and Hygain. This was very useful since I have antennas from each and had some questions. Also, every linear manufacture except was Henry (boo) was there with the top off so you could see the innards. Great to compare band switches, coils, cooling, plate chokes, etc. No unanswered questions!

The DSP stuff from PAC COM and AEA went over like a lead baloon to the masses. No surprise there.

The flea market was real interesting. Some real good buys if YOU KNEW WHAT YOU WERE LOOKING FOR. A great job by the sponsors. Thanks to them for a super HamVention.

PS. I walked my self to death, If you plan to go next year do some walking to get ready!

bye...

2579. DAK SW radio arrives: review

Newsgroup: rec.ham-radio
Date: 1990-05-02 22:13:35 UTC
From: charlier@hplsla.HP.COM
Message-ID: <5720065@hplsla.HP.COM>
Source record: 11971

After about 6 weeks of waiting, the $50 shortwave receiver from DAK finally arrived. Mind you, I didn't expect too much for $50, but I was still quite disappointed initially. AM and FM broadcast reception is OK, but the thing is basically useless for SW with the little whip antenna attached. The only thing I could hear was a *weak* WWV on 15 MHz. Mind you, in the same room was a 30 year old 5-tube Grundig, with a 3-foot piece of wire that was picking up LOTS on the same frequencies. At first I thought it was kaput, but I hooked up my ham-band delta loop to its external antenna jack, and it came alive. This fault seems really dumb, as gain is relatively cheap to build into a SW receiver. (selectivity, image rejection and dynamic range on the other hand...) Even given its 'deafness', I did hear a touch of overload from the local 1kW BC station, about 3 miles away.

I brought it into work today and hooked it up to a calibrated signal generator, and made the somewhat crude measurements below. I also attempted to peek inside, but didn't get too far. I got the back cover off, but that only lets me see the back side of one of the PC boards. It seemed to be glued or heat staked to the 'front panel'. It seemed to have a surprising number of discrete components, though, along with 2 or 3 DIP IC's that I could see. If I decide to keep it I may look some more..

At first I was ready to send the thing back, but now I'm not so sure. I could probably add a little RF amplifier, either internally, or externally, and it would be quite serviceable for casual use.

It is kinda cute. The tuning with the up/down button is tedious, and it will 'scan' if you hold them down for a second (not too useful on noisy shorwave freqs) It also has a jack for an external 6V power supply, something Drew didn't mention in the catalog.

DAK MR-101 Synthesized World Band Receiver

Sensitivity (for minimum discernable signal):

Freq Sig Level
3.2 MHz 40uV
5.0 MHz 14uV
7.0 MHZ 7uV

10 MHz 8uV
14 MHz 7uV
20 MHz 4uV

Image rejection:

~ 6dB at 12MHz (that's right, 6!)

IF frequency (SW1 and SW2): 440 kHz (I attached a loop of wire to a spectrum analyzer and held it near the back of the receiver. The largest spur seen was always exactly 440kHz above the dial frequency.)

>
> Marquette is a place where WEIRD things happen with Radio Signals.

Well first of all 47 Degrees is not all that far North. It is about
the same latitude as Nantes France. It is south of London, Berlin,
Copenhagen, Warsaw, Den Hague (That's enough dreary capitals -Ed). But
the question I suppose should really be, how far North is it from the
"Magnetic Equator." I dimly recall that a stations position relative
to the magnetic equator is important vis-a-vis Aurora and HF
propagation.

But first, lets assume that Marquette is in Aurora Country and is
also sitting on top of a fair amount of iron ore. There is a similar
location in Sweden. The world's "largest city" (in square kilometers
of desolate Tundra) is Kiruna. It is also an enormous iron mine. Hams
there should experience the same phenomenon as Gary.

I remember in the seventies hearing a second hand story that DX was
pretty bad off the Southern Tip of Sweden (Ystad, Trelleborg) because
there were massive Iron deposits just offshore. The story involved not
getting out and not hearing too well. Southern Sweden does get a few
Auroras also.

No good answers I'm afraid, but certainly some points of reference and comparison. All we need now is a report from Kiruna.

Note: Marquette is about 47 degs North, Helsinki - 60 degs North and Kiruna - 68 degs North.

Not quite EVERY manufacturer. I was disappointed that Advanced Radio
Devices (ARD 230A) did not show up this year. If you were at dayton
last year, you saw what a REAL amplifier looks like.

ARD was considering building an automatic antenna tuner which I was
hoping to see there. I also noticed that ARD is no longer listed
in the latest AES catalog. Perhaps they are too busy with commercial
work to spend much time on amateur radio products. This would be
a pity since their amplifiers are clearly head and shoulders above
any other amplifier on the amateur market today.

2590. Temp linking of repeaters via autopatches

Newsgroup: rec.ham-radio
Date: 1990-05-03 15:16:03 UTC
From: mikey@pnet01.cts.com
Message-ID: <2509@crash.cts.com>
Source record: 11897

I had a thought (watch out). Anyone interested in tying some repeaters together for a chat using autopatch to autopatch?

I think it would be a kick to chew the fat coast to coast FM mobile. You know, reach out and touch (careful) someone. Interstate costs are quite inexpensive at 60% off prime on weekends. Say a Saturday afternoon or evening. Our 220 repeater club in Sandy Eggo would like to give it a try if there are any takers.

Just think, if someone has conference calling on their repeater line, then we could get 3 boxes connected. Think about it, talk it up, see if you can get your members to check in at the annointed time. The more hams listening at both ends of the line, the better. The "San Diego Los Angeles Intertie Club" (SLIC) will start the ball rolling at initiate the calls, so NO cost to your club if you'd like to participate.

We can be found at 224.16 Mhz, PL 1B, San Dgo County, Cuyamaca Peak, 5900 feet, Coverage into Organge County if you care to chat on our system about the idea. Any comments, suggestions (positive only please), or input is solicited.

2591. Mail callbook server available

Newsgroup: rec.ham-radio
Date: 1990-05-03 15:17:01 UTC
From: lcz@dptspd.sat.datapoint.com
Message-ID: <469@dptspd.sat.datapoint.com>
Source record: 11896

I (finally!) have an amateur radio callbook server online, available via email. This server is still in the testing phase, so please let me know of any problems. There is no FTP access to the server, but there are other sites providing that. Currently, the only search key is the callsign. If there's enough interest, I may add other search criteria later.

Here is a copy of the help file:

The callbook server is accessed by sending mail to callbook@sat.datapoint.com. Include the following line in the body of your message:

lookup <callsign> [<callsign> ...]

The maximum length of a lookup command line is about 200 characters. You may specify more than one lookup command if needed.

The following commands are also recognized:

help - return this help text.
quit - quit scanning for commands.

Quit is not needed, but may be used if you have a signature that contains things that look like callbook commands.

The callbook data is taken from FCC records as of September 1989, as provided by Rusty Carruth, N7IKQ.

If you have any questions, send mail to callbook-help@sat.datapoint.com.

Thanks,
Lee Ziegenhals, N5LYT

When you mention a magazine (especially somewhat obscure ones), please try
to include an address or phone number so we can follow-up.

In an earlier posting, I mentioned that _VHF_Communications_ (a translation
of a German technical Ham magazine) was available from "Timekit". I am still
waiting for a copy of the magazine, but here is the address and phone:

Timekit
P.O. Box 22277
Cleveland, OH 44122
(216) 464-3820

As far as I can tell, this phone number is the home phone of Mr. Fred R. Sharp,
who is semi-retired and runs Timekit from his home (so be considerate when
choosing a time to call). He apparently also sells Ham radio kit projects
as well. _VHF_Communications_ is published four times per year, and costs
$20.95 per year. I will report back to this group after I see a copy.

I just started playing around with HF packet on 28.109 mhz. It is really quite a lot of fun. It took me a couple of days to finally get my radio and PK-232 set up properly. I was using the squelch line from my IC-725 to the PK-232. By using the squelch line I was losing some of the marginal signals. After removing that line things worked much beter.

Anyway...what I would like to know are the rules of etiquette, if any.

```

In the late 50's, I built one of these cut for 10 meters. (10 was used a lot like VHF by locals back then.) It really worked like a champ. The nice thing about the J-pole from a safety pint of view when tower mounted is that it can be grounded at the bottom, eliminating the need for lightning arrestors.

The "by hand" business only replies to SENDING, not receiving. Besides, how many people do you know who type by their toes or nose? Most folks type by hand anyway.

Copying by typewriter or computer keyboard *IS* copying by hand !!

What is NOT copying by hand is letting any mechanical, electrical or
algorithmic device do it for you.

If the VE's refuse to allow copying by hand in its various forms,
contact the VEC and ask for this to be corrected and a makeup exam
session to be scheduled. If the VEC refuses, get another VEC to
do some exams in your area.

HR Magazine USED TO BE a less fancy magazine. I must say I have enjoyed the art work that has been done on the covers. But I believe HR could have been operating much leaner. I remember when the covers were simply 2 color and the whole magazine was smaller. I guess I will need to start reading some other technical magazines. The lack of publicity about them has been the major reason I have not been getting them. I will now be collecting info about the various ham radio publications in a file, and once it is reasonable enough, will post it. If you e-mail or post info you know, please make sure the info is complete and correct. If you have not verified the rates for subscription within 6 months, please do so.

>One of these days a WHACK isn't going to work, and we need help!

Ha! You guys may be in luck, since I fixed mine -- I have the service manual
and decided to jump in (I had upgraded the software and you have to pull the
unit completely open to do it --). Anyway, I was using the rig one day and
the next -- no audio -- just a slight noise that appeared to be white noise
from the final audio buffer. When plugging in the speaker mike -- same
problem. Touch the TTPAD and get your ears blown away -- I think beep also
worked. Kenwood had no knowledge of previous problems.

I had to rig up a jumper ribbon cable so I could lay the rig out for
testing and immediately checked the input audio to the volume control.
No problem -- but there was nothing coming out the other side. I jumpered
the pot (i.e. simulate pot max volume) and my ears were hurting. Upon
removal of the pot I found a crack on the ALPS pc board that has the leads
mounted to it. Apparently, I must have hit the volume control pot the
previous day and cracked the pot trace (again this trace was part of the pot not
the rig pcb). I had noticed when I disassembled the unit that there was
no nut on the pot to hold it in place (none on the squelch either). The
volume pot is right at the edge of the unit and is most likely knob to
get hit.

When parts arrived, it came with a nut so I installed it to help prevent
this problem in the future -- no problems since. (I failed to mention that
I shorted out the power lead to ground and blew a diode in the power ciruit.
It was obvious which one. -- so be careful!)

I think the switched volume pot cost $4.95 + $3.00 shipping.
(the diode looked like a fused type so I ordered that too for $1.95.
The one they sent me was a normal silicon power diode so I don't have
to guess anymore. I also picked up a set of backcase screws -- very small
heads but very long screws to replace my old ones -$.05 - Make sure you have a
"good" screwdriver that really fits.)

All these problems sound like the same thing. I have never had any problems with my rig, and I bought one of the first ones out. (Hence, the software update to give me the ability to lock out memory channels during scan.)

Hope this helps.

>is a salesman, and likely was just as lost as I/we are. :-]
>
"As long as you don't act on the basis of what you hear, you are breaking no
laws." Now let me tell you the reality...

I have a close friend here locally (N...) who is the proud new owner of a
R9000. After a good deal of urging, he persuaded me to join him for a few beers
and listen to the 9000. So up to 800MHz we went, and in a half hour I got...
- a dope deal being set up;
- a replay of last night's sex scene between Mr. X and his secretary, together
with how X was planning on getting away from the wife and kids again
tonight;
- several discussions of corporate takeover strategies (this is Silicon
Valley);
- etc.
It was hilarious, just as my friend promised me. (But not entertaining enough
that I would even think of plunking down $4K+ for a 9000 of my own.) Apparently
there are a lot of salesmen out there claiming cellular calls can't be monitor-
ed. Worse, there are a lot of people who believe it!

That's what makes intermittent problems so great.

> One of these days a WHACK isn't going to work, and we need help!

Exploratory surgery might be in order.

I once had a spurious bug in a major IBM mainframe operating system, and
IBM claimed it could not possibly do what I said it was doing. I looked
at the source and found it, but they still denied it was a bug. I fixed
it and sent them the fix. Two releases later, my code was in it.

> has before the WARC a proposal to convert all between 1000 and 3000 Mhz to
> Land Mobile. We had better get our act together and fast.

I recently had a conversation with a local ham, not over the air, concerning the density of amateur FM/repeater communications in large metropolitan areas. He had spoken with another ham from such an area who had the perspective that in his area (LA) the 2m, 1.25m, 70cm, and even the 23cm were FULL. He had the perspective that 1 QSO per day made the repeaters "busy".

If you want to see what ***FULL*** is really like, take a look at the Land Mobile spectrum. LM needs spectrum, they need it badly, and they need it NOW! Compared to LM usage, 2 meters is a barren wasteland!

We are going lose LOTS and LOTS of spectrum to Land Mobile and other interests (HDTV perhaps) if we don't get our act together and DO IT NOW! We need to CUT THE BS and make our bands MUCH MUCH more used than they are now.

Back to the subject. The HF spectrum is being highly ABUSED, but most of it is reasonably crowded now. Here is your chance to help reduce the problem. QSY from 20 to 2 or 220. Let's start getting more hams we have now to actually USE the VHF and UHF spectrum. If you tune across all the repeaters and find LESS THAN 80% in use, then the band is WIDE OPEN for you to use. GO FOR IT!

The ARRL doesn't have any authority to do anything about the HF problems. They can ask for more "gentlemen's agreements", but what is really needed is some regulatory and enforcement teeth. The FCC is not going to do this for us, so we need to find ways to do it ourselves.

If we don't act, then SOMEDAY, ham radio will be totally gone, and what use remains of the radio spectrum will be CB and outlaw.

If you are one of those people who claim that ANY VHF or UHF band ANYWHERE is full or crowded or too tight for a QUADrupling of usage, then BURN YOUR TICKET AND GET OFF THE AIR.

It may or may not be illegal, but I KNOW it is definately possible. While
working on a radar detection and classifaction system at a local defense
contractor, we were doing some chamber testing in the lab. As these tests
take hours, we decided to amuse ourselves. HP makes a nice little spectrum
analyzer (I forget the part number) that contains built-in AM/FM demodulators.
We just stuck an antenna into the input port (a bent paper clip worked the
best of all antennas we tried) and we could tune into any signal in the band of
interest. In this case, the band of interest was the cellular phone band.
We could pick any channel in the band we wanted, hit 'peak find' to center
the demodulator, and then turn on the audio. Quite fun for about 1 hour.
We noticed that most calls are for real-estate deals taking place and guys
trying to impress their girlfriends. One guy was calling his woman while
sitting in her driveway. If you want to make it private, DONT'T do it on
cellular.

>laws). I believe the Supreme Court decided this awhile ago. Does anybody have
>any details? If I said I was sure I was right, I'd be a liar, but I'd like to
>know exactly what the laws say.

Thanks to intense lobbying by the cellular phone industry, a law was passed
making it illegal to sell equipment capable of receiving cell phone calls or
to listen to such calls. The implication of the former is that scanners sold
new have the cell frequencies blocked, usually by the installation of a diode
which most people easily find out how to remove. The fact that the latter is
in direct conflict with the Radio Act doesn't seem to bother the lawmakers.
The end result is that it is both possible and illegal to listen to cell phone
calls.

This subject has been discussed at great length in the moderated
comp.dcom.telecom group. That's the best place to go for detailed, specific
info on this topic.

2615. More Kenwood TH-315 Problems

Newsgroup: rec.ham-radio
Date: 1990-05-04 04:43:08 UTC
From: lawrence@smcnet.smc.edu
Message-ID: <1990May4.044308.1378@smcnet.smc.edu>
Source record: 11913

Well I have not lost the volume on my Kenwood radio yet. (knock on wood)
I have the 220Mhz Kenwood TH-315A and it has been working fine up until
tonight. When I unplugged the unit from the wiring harness that I have
rigged up in my truck, the radio "locked up". I couldn't change channels
or get and audio out of the the thing. The unit was still displaying the
repeater frequency that I was just listening to and the S-meter was
on full scale even though I had not plugged the rubber duck into the unit
yet. Turning the unit off an on a few times, the HT seemed to reset itself
including erasing all of the memories.

Just wondering if anyone else has had this problem with their rigs?

If a $300 box can decode it, it wouldn't cost much more to build an encypherment unit that will bury the characters so deep that no one can decode them, especially at 5 to 10 characters per second.
In several years of messing around, I've discovered that if the signal has a wide shift (850 Hz?), that I'll have little or no chance of printing anything. These are probably military.

> data, giving "gunk".

After looking at the scope outputs of my '232, I don't trust the linearity of the automatic level control in the filters at all. Overdriving the input will add all sorts of spurious crud, and the same can be said for the audio section of the receiver. I use a Kenwood R-1000 and tap across the audio output with an transformer, cranking down the volume control to the minimum level that gives good copy. The audio transformer (8 to 500 ohm) steps up the voltage so that the audio amp in the receiver is operating at a low level.

2619. AOR-???? vs ICON ???? receiver recommendations

Newsgroup: rec.ham-radio
Date: 1990-05-04 13:01:56 UTC
From: mpe@shamash.cdc.com
Message-ID: <20498@shamash.cdc.com>
Source record: 11923

Could some kind soul out there in net-land please forward any and all experiences with receivers from AOR and ICOM. I'm interested in a very broad band receiver (say ~50khz through >1Ghz) with continuous band coverage in 50khz or less steps. Costs should be reasonable!!!

Some of the items of interest are the sensitivity of the unit versus frequency and the guaranteed frequency max (some unit's specs are only stated for a portion of the entire spectrum and have limits well inside the max freq the recevier is capable of tuning).

Thank you in advance for your help and patience...
Mike Ebsen mpe@shamash.cdc.com

2620. CW and conversation

Newsgroup: rec.ham-radio
Date: 1990-05-04 13:06:53 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <9005050651.AA01128@ucbvax.Berkeley.EDU>
Source record: 11847

In a recent posting, John Broughton (WB9VGJ) related his experiences as a military CW interceptor. He mentioned that he could eventually carry on conversations while copying CW. This brought something to my mind.

I have been a ham for >20 years, and CW is enjoyable and no hassle at all. 20-30 WPM is routine. However, I have found that I simply cannot speak while sending. Listening to others speak, even while copying CW, is easy, but I can't utter a sound while sending. I suspect that the fact I'm left-handed has something to do with it (you know, brain organization and all that).

Has anyone else encountered this, or have any suggested interpretation?

My interest in DSP began with WB2TNL over two years ago. Then more
recently with Brooks. I am a real fan of DSP and hope it takes off
like a rocket. Speaking of rockets you missed a good one at McNastys.
I had the pleasure of sitting next to MOV and across from Brooks and IWI.

Anyhow, my impression was that people who already had some knowledge
of DSP were real excited. Those who saw it for the first time could
not quite figure out what it was. Maybe some education in the form
of articles in mass circulation magazines. Ham Radio just did one,
but it propably isnt read widely enought.

Also, "like a lead baloon" may be too harsh. With all due respect
to those like yourself who have done MUCH work on the subject new
things take time to develop. I am sure that DSP will be a real hit
once it is in the market place and its benefit over a TNC is known.

Keep up the good work DR. BOB. I for one appreciate it.

|>is a salesman, and likely was just as lost as I/we are. :-]
|"As long as you don't act on the basis of what you hear, you are breaking no
|laws." Now let me tell you the reality...
|
|It was hilarious, just as my friend promised me. (But not entertaining enough
|that I would even think of plunking down $4K+ for a 9000 of my own.)

You don't need to spend $4k for an 800 MHz receiver. The Bearcat (Uniden)
200XLT portable picks up all the cellular frequencies offset 21.7? MHz higher
(something to do with a harmonic and the way a superhet receiver works).
Retails for $250. If you want them to be at the correct place, there is a
modification (adding or removing a resistor) that unlocks the cellular band
(only the American ones are locked out because of the Electronic Privacy Act,
the foreign ones are made with the frequencies accessable). In addition to
the cellular band, you get 200 channel programming in 10 bands and coverage of
just about all Fire/Police/Emergency/Weather/cordless phone/CIA/FBI/etc..
frequencies, all in a portable with a rechargeable battery.

The folks on the Evergreen Intertie, which is a network of repeaters here in the Pacific NW, semi-regularly do this sort of thing on Tuesday evenings. A "local net control" station will autopatch into a distant repeater, where another station acts as net control in that area. I've said Hi into Atlanta and Ohio while mobiling home from work over that setup.

A related fun thing they do on the Intertie is tie in an HF big gun station for some real DXing. Last Christmas I used my 2 meter micro HT in a room in Timberline Lodge on Mt. Hood, Oregon, to exchange New Year greetings with hams in Beijing via the Intertie and a big HF station in Seattle.

This sort of thing is a very good idea.

The ECPA prohibits reception and listening of cellular (and some other)
type of communications. Scanners and receivers with the capability to
receive the frequencies cellular is on are still done legally, and are
even needed for some non-cellular applications (such as monitoring for
harmonics of your 2 meter transmission in order to verify compliance
with FCC rules on spectral purity, including the sixth harmonic which
happens to be on the cellular base transmit band).

After I got my Icom IC-2GAT I was having trouble getting the tone encoder (built-in) to work right. I was trying to HEAR the tone on my scanner, but could not.

A few weeks later I finally installed the UT-40 tone squelch option. It is a board that replaces the tone encoder board and performs both encode and decode functions. When I removed the tone encoder, I found a bent pin. It was the power supply pin and was bent all the way to the side and never made contact.

Once the UT-40 was in, I could hear 250.3 Hz through the scanner.

There are always these little manufacturing glitches.

Thanks to intense lobbying by the cellular phone industry, a law was passed
making it illegal to sell equipment capable of receiving cell phone calls...

There is no such prohibition. If you think there is, provide a citation.

The fact that the latter is
in direct conflict with the Radio Act doesn't seem to bother the lawmakers.

The ECPA supersedes the Communications Act of 1934 (in the area under
discussion.) There is no conflict. Both are reasonable, Constitutional
statutes which attempt to balance the rights of users of the spectrum
and the rights of random radio listeners. The fact that the random
listeners were further restricted by the ECPA is a matter of public
policy; if you don't like the policy you should change it by intense
lobbying of your own.

This subject has been discussed at great length in the moderated
comp.dcom.telecom group. That's the best place to go for detailed, specific
info on this topic.

If your information came from that group, you should go back to them and get
more accurate information.

2634. More info on callbook server

Newsgroup: rec.ham-radio
Date: 1990-05-04 20:33:49 UTC
From: lcz@dptspd.sat.datapoint.com
Message-ID: <473@dptspd.sat.datapoint.com>
Source record: 11831

I forgot to mention some things about the callbook server available via email to callbook@sat.datapoint.com.

First, there is an additional command, "path", that may be included in your message to specify a return address. Normally this should not be required, but if your requests seem to go unanswered, you might try it. Either a domain specification or a bang-path is acceptable.

Examples:
path bob@foo.com
path uunet!foo!bob

Second, the database includes only FCC assigned (U.S.) callsigns, but it does NOT include club stations. Club station information does not appear to be available from the FCC in machine readable form.

I have updated the help file to include the above information.

From: jack@swlabs.uucp
Message-ID: <1990May4.203531.15322@swlabs.uucp>
Source record: 11852
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

I have a PK-232 and had been running the PC-Pakratt software for
over a year on a genuine AT without incident.

I have recently put a 386SX in the shack and find that there is a timing
dependency in the PC-Pakratt software that prevents it from operating.
The software indicates that it is "Unable to establish communications
with Pakratt" and terminates.

When I called the tech support at AEA, they told me that indeed there
was a timing dependency in the PC-Pakratt software and that the
original authors of the code were nowhere to be found. I asked about
a fix and they indicated that they had a new program that was going to
be released during the summer. At that point, owners of PC-Pakratt would
be offered a "deal", I was told.

So it looks like the near term solution is to patch the timing loop to
eliminate the problem. To save the time, has anyone on the net
hacked/patched PC-Pakratt to eliminate this problem?

> -dave

True! Very true, at least for now. Current domestic analog cellular communications use traditional FM transmission characteristics at least for the voice channels. The only thing that may provide a bit of a problem for eavesdroppers is that the in-progress call may migrate (hand-off) to another channel at any time so the listener will either need to hunt for the new channel or find another interesting conversation on another channel.

The beginning of the end of this is near however. The analog RF transmission will soon begin to be replaced by digital RF transmission where the base station equipement will transceive along with the mobile subscriber unit in a proprietary, digital format. It will still be possible to tune some scanner or piece of equipement to a busy channel but all that will be heard will be the bumble-bee buzz of the digital transactions. While I wouldnt say that it would be impossible to decode this, those thinking of it will be sumpremely challenged: One RF radio channel will have several digital voice channels multiplexed onto it and will be encoded using some pretty high-speed digital signal processors.

Like everything, this will take a little time but the scenarios like Dave described will soon disappear.

I still think this is another of those urban legends, perhaps even a deliberate invention. But even if it is true, it is just one more piece of evidence that the code test is a meaningless waste of time for anyone of any age.

I took a lot of flack when I asked once in the Fidonet HAM conference, "If ham radio did not exist and you were given the job of inventing it, would you include a code test and why?"

>I can get a set?

The crystals in question were galena; find a rockhound
or hobby shop and you should have no trouble locating some. A
bottle cap and some solid solder, heated on a stove, will give
you a bottom contact (just drop the galena in; it'll float).
An old fashioned safety pin makes a good probe.
Variations on galena are possible: almost anything chrome plated, or
a steel razor blade (with the blueing etched off) works fairly well.
In fact, I once took a crystal earphone, held the barrel of the
connector in my fingers and 'grounded' the tip to a variety of
household metal surfaces. Most of them rectified somewhat.
An old variation on a cat's whisker was a "coherer"; this was a
glass tube with metal chips. When the rectification failed, one simply
shook the tube to change the chips' contact points.

I am known for my brilliance, John Whitmore
by those who do not know me well.

Yup, that was what always seemed to happen just as the conversations got
interesting. You would need lots more equipment to do a really proper job
of tracking down one desired phone of interest and keeping up both sides
of the conversation. One big problem was that the person being talked to
(the normal land line, not the mobile phone) was very faint. I was told that
the only reason we got both sides on the same demodulator was that we were
picking up energy mismatches (bad impedance matching) from the land line when
it was sent to the cellular. That would make sense, since some conversations
could only pick up the mobile side or the land side. Most conversations were
legible on both sides, though.

I'm not sure if this will true. I figure that to keep costs of cellular down,
they won't go to anything too expensive like TDMA or packet. Takes too much
inside the phone, and makes the current system obsolete. They may digitize,
(probably will) but the transmission will be some kind of fairly simple scheme
that fits into today's FDMA mode of operation (It is FDMA isn't it? At least,

that is my understanding of how cell phones work. I could be wrong) Simple encoding schemes mean simple answers for tuning in, like taking a scanner output tuned to the cellular bands and feeding it into an old defective cell phone that understands decoding digital stuff. In fact, it might not be that hard to just trick your phone into receiving the same signal being sent to the active party. Since you wouldn't have transmit capability, you would be merely eavesdropping. Also, don't think that just because you scramble doesn't mean you can't be tuned into. There are going to be a proliferation of cellular test sets and various other pieces of equipment that are quite capable of the job. Who would have ever thought one could use a spectrum analyzer (and a paper clip) available off the shelf to do this? Not me, until I was shown. I still stick to my original premise:

If you want to make it private, DONT'T do it on cellular.

>
>Like everything, this will take a little time but the scenarios like
>Dave described will soon disappear.

Time will just up the stakes and introduce new wrinkles and variations on the theme. Most folks will cease to be able to get clear cellular broadcasts, but there are always the techno-zoids that will figure it out for kicks. And the CIA. And the FBI. And the NSA. And the.....

> Mike

-dave

P.S. - As a side note, how many folks read Tom Clancy's book called, "Clear and Present Danger"? In it, Mr. Clancy describes a very interesting means of tuning into cellular phones in Columbia to nab high profile drug dealers, all done by members of the U.S. Govt. Very High tech, more than just slightly believable. Does he know something we don't? If you want more info, read the book. It's very good, and I don't want to spoil it for those that haven't yet read the novel.

>typewriter to copy the code test isn't allowed cause the rules say by
>hand, I hardly expect they let anyone use a compputer.

The VEs here allow the use of typewriters. In discussing it, they felt
that it was ok, but would probably test them by themselves, so others
wouldn't be annoyed by the noise.

>Add into that
>the illogical (for a child) layout of a QWERTY keyboard and this story
>really looses credibility. I personally would need a lot more verified
>info before I believed it.

illogical ? Kids are really good at figuring out rules systems.
Mapping morse onto QWERTY is just another conditioned response. Maybe
I don't understand why a kid couldn't punch keys at 5 wpm.

My old cub scout handbook said to use a safety pin and a piece of galena (lead crystal). You probe the galena until you find a spot that behaves like a diode.

I'd rather use a 1N34. :-)

MONDAY MAY 7, 1990

SpaceNews is published and distributed weekly around the world on USENET
and Amateur Packet Radio. It is available for unlimited distribution.

* STS-31 NEWS *
===============
STS-31 POSTFLIGHT CREW PRESS CONFERENCE SET

The STS-31 astronaut crew will meet with news media at the Johnson Space
Center on Wednesday, May 9, to discuss the recent mission to deploy the Hubble
Space Telescope. The event will begin at noon EDT and consist of a slide and
video presentation by the astronauts, followed by media questions.

News media may participate in JSC building 2, room 135, or via two-way
communications from NASA Headquarters, Washington, D.C., the Goddard Space
Flight Center, Greenbelt, Md., the Kennedy Space Center, Fla., or the Marshall
Space Flight Center, Huntsville, Ala.

Live NASA Select television coverage will be carried on Satcom F2R,
transponder 13, 72 degrees west longitude, frequency 3960.0 MHz.

[From: Peter E. Yee @ NASA Ames Research Center, Moffett Field, CA.]

* STS-35 NEWS *
===============
Launch of Columbia on the STS-35/Astro-1 mission remains targeted for May 16.
The official launch date will be set at the Flight Readiness Review to be held
May 7-8.

Astronaut and ham-radio operator Dr. Ron Parise (WA4SIR) will be carrying an
Amateur Radio station with him on this mission and will contact other
ham-radio operators on the earth below from the space shuttle.

* OSCAR-11 NEWS *
=================
ASCII Single Event Upset (SEU) downloads have been suspended. OSCAR-11 is now
transmitting Whole Orbit Data (WOD) and SEU data in a new "packetized" format.
The general format is as follows:

S0 S1 ID T0 T1 T2 T3 T4 T5 F0 F1 D0 D1...D63 C0 C1

S0,S1 : SYNC MSB,LSB
ID : Data Ident
T0..T5 : Timestamp
F0,F1 : Frame Counter MSB,LSB
D0..D63: 64 Data bytes
C0,C1 : Checksum MSB,LSB

Here is an On-Board Computer (OBC) status information bulletin received from
OSCAR-11 on 05-May-90 at 01:47:17 UTC:

2645. ICOM R9000 Computer Control

Newsgroup: rec.ham-radio
Date: 1990-05-05 04:39:47 UTC
From: COLE@BABETTE.ISI.EDU
Message-ID: <641882387.0.COLE@babette.isi.edu>
Source record: 11850

This is a reply to Bert Campbell, N5KGT, regarding his request for info about some details regarding computer control of the ICOM R9000. I don't have easy access to Usenet to EMail Bert, and there might be more than two of us out there with R9000s, so please excuse the reply via the group.

To read a memory (say Memory 321) on the R9000, send the following sequence of packets:

Set memory: FE FE 2A F1 8 3 21 FD
Read freq: FE FE 2A F1 3 FD
Read mode: FE FE 2A F1 4 FD

(the above assumes the R9000's address is 2A, which is the default, and the computer's address is F1. All bytes are hex.)

To set a memory (for example to set Memory 456 to 1234.567890 MHz FM medium), send:

Set memory: FE FE 2A F1 8 4 56 FD
Set freq: FE FE 2A F1 5 90 78 56 34 12 FD
Set mode: FE FE 2A F1 6 5 2 FD
Write VFO to mem: FE FE 2A F1 9 FD

Here are some new commands which work on the R9000:

Command E followed by a second byte (subcommand) of 0 makes the radio stop scanning if it is scanning. However, I haven't been able to make it START scanning. Example: FE FE 2A F1 E 0 FD.

Command 10 followed by a subcommand sets the tuning step. Subcommand 0 sets 10 Hz, 1 sets it to 100 Hz, up to subcommand 9 which sets it to 100 kHz. I haven't found out how to READ the tuning step, however.

Command 11 followed by a subcommand sets the attenuator. Subcommand 00 turns it off, 10 sets it to 10 dB, 20 sets it to 20 dB, 30 sets it to 30 dB.

Command 12 followed by 0 turns the antenna select OFF. Command 12 followed by 1 turns it ON.

Command 13 replies with a positive response (FB) but I can't see what the heck it does. My best guess would be that it makes the optional speech synthesizer speak the frequency,

if you have one, which I don't.

Command 14 followed by a subcommand and a data byte sets AF gain, RF gain or the squelch level. Subcommand 01 sets AF gain to a value from 0 to 255 given in the data byte. Similarly subcommand 02 sets RF gain and 03 sets the squelch level. For example, FE FE 2A F1 14 01 80 FD would set the AF gain to a value of 128. It's obviously best to debug this one while NOT using headphones with the R9000.

Command 15 reads the S-meter. The reply message contains a data byte with a value from 0 to 255 which represents the current S-meter reading.

One of the mysteries of life is why ICOM USA is told so little about the computer interfaces on their rigs. I called ICOM and talked to Tom Moore of ICOM Customer Service, who is very helpful. He told me about Commands 11, 14 and 15. I found the others by experimenting. Don't they work all the time? Don't all R9000s have them?

Incidentally, I haven't had a whole lot of luck with baud rates above 1200. That goes for all the ICOM rigs, not just the R9000.

If anyone knows what Command 13 does, how to read the tuning step size, or how to start scanning, I'd certainly appreciate knowing.

Not true. Sale is not outlawed, but Uniden and Radio Shack both have
a large interest in cellular phones. If that were true, the Icom
R-7000, R-9000, and Yaesu FRG-9600 would have disappeared years ago.

From: markz@ssc.UUCP
Message-ID: <687@ssc.UUCP>
Source record: 11856

On tonights Wall Street Week, the guest paper hanger said that in two years the digital cellular phones will allow three times as many conversations.

But he said that the next generation after that will give another threefold increase. Is digital voice technology good enough so that 9 (Toll quality) conversations can take place in the 60 Khz of spectrum used by one analog cellular conversation? (Or is someone elses spectrum going to get used)

markz@ssc.uucp

2649. SSTV -- What's recent?

Source record: 11853

I'm interested in finding out the current state of Slow Scan Television -- preferably information about non-digital SSTV. Are there scan converters readily available to encode TV images into voice-bandwidth transmissions? Anything low-cost? What's "typical" (time-wise) for a complete 525 line transmission? What is available in the way of a decoder? Thanks in advance for the information -- No, I'm not a Ham Radio operator; I have a friend who is looking for this information (he doesn't have access to the network).

If you are referring to:
26.995, 27.045, 27.095, 27.145, 27.195
then you are referring to the Class "C" frequencies. These are intended
for non voice use. These frequencies are mostly used for remote
control applications. Radio Shack uses some of these frequencies for
their remote control cars, etc..

Is this what you were referring to?

**** UoSAT-OSCAR-11 BULLETIN - 215 03rd May 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

* NEW DATA FORMATS *

The new Forth-Diary binary packetised data format is:

S0 S1 ID T0 T1 T2 T3 T4 T5 F0 F1 D0 D1...D63 C0 C1

S0,S1 : SYNC MSB,LSB
ID : Data Ident
T0..T5 : Timestamp
F0,F1 : Frame Counter MSB,LSB
D0..D63: 64 Data bytes
C0,C1 : Checksum MSB,LSB

1.SYNC

5041h for UoSAT-2, 4534h for UoSAT-3.

2.ID

01 Engineering frame. 1 packet
02 Memory dump. Variable number of packets, only for debug purposes
03 Telemetry. 3 packets
```

04 SEU data. 10 packets
05 Extended Engineering. 2 packets
80h..FFh WOD

The WOD ID byte is incremented every time a new WOD survey is started.
It starts with 80h, and goes to FFh before going back to 80h.
UoSAT-2 WOD outputs 372 packets, UoSAT-3 WOD is 352 packets.

3.Timestamp

Each frame is timestamped at transmission.
T0 is seconds, T1 minutes, T2 hour, T3 the day, T4 the
month and T5 the year. All are in BCD format.

4.Frame counter

Each frame is numbered according to the number of packets, as
specified in 2:ID.

5.DATA

5.1.Engineering frame

Byte
0: Day number. 1=Sunday, 7=Saturday.
1: NA
2: WOD survey start seconds (BCD)
3: '' minutes
4: '' hours
5: '' day
6: '' month
7: '' year
8: Diary Mode: 0=Auto, 1=Manual.
9: Last command received.
10: Command set/reset.
11: Command data.
12: Attitude control active.
13: Attitude control mode: 1=spin, 2=Mag Lock, 3=delib, 4=1 and 3.
14: WOD collection in progress.
15: WOD # channels
16: 1st WOD channel
.. ... ''
25: 10th ''
26: WOD Survey Number
27: Total SEU's (MSB)
28: '' (LSB)
29: WASH RAM pointer (MSB)
30: '' (LSB)
31: Manual mode time-out counter (minutes)

Followed by 32 bytes of engineering data.

5.2 Memory

Memory dump, variable number of packets.

5.3 Telemetry

Each TLM channel uses 2 bytes.

5.4 SEU

Each of the 64 SEU entries:

T0 T1 T2 T3 T4 T5 A0 A1 C0 C1

T0..T5 : time of SEU detection
A0, A1 : address of the SEU (msb,lsb)
C0, C1 : SEU counter (msb,lsb).

ASCII download of SEU has now been stopped.

7.5 Extended Engineering data

These are two frames of variable data, mainly Attitude Control
related.

5.6 WOD

Frame 0: T0..T5 N C0..C9 wod data..
All other frames: wod data

T0..T5 : survey start time
N : number of channels
C0..C9 : WOD channels
wod data: (4 channel example)

byte0 byte1 byte2 byte3 byte4 byte5 byte6 ...
MS MD LS MS MD LS MS MD LS MS MD LS MS MD LS ...
Channel1 Channel2 Channel3 Channel4 Channel1 Channel2 ...

MS: MSnibble, MD: Middle nibble, LS: LSnibble.

ASCII WOD: the checksum on UoSAT-3 should now add up to 204 (CC hex).

6.Checksum

Byte wise addition of all bytes, modulo 10000h.

** BID **

Please use BID $UOSAT.215 for PBBS use.

>

I keep saying this, and I keep getting told that I don't understand
etc. But somehow there is a feeling that if a frequency has been
"assigned" it is being used. Most of the "assigned" repeaters etc on
70 cm in LA are not used. No, I don't call two co-owners who chat for
10 mins per week use. That is equipment testing.

Even on 2 meters, here in LA there are repeaters that are hardly
used. Once myself and a friend were using 145.55 for chats. We found
that there was a repeater near there. Yup, every Thursday at 19.00
the "Net" met there and played the Westlink tape. RF spectrum is a
precious resource, we have to stop piddling it away.

Given the ease with which an AM video signal can be interfered with,
allocating one channel means that several channels are blocked within
a given distance. Transmitters that are Co-channel, Adjacent Channel,
Sound Image, Picture Image, Local Oscillator, If Beat, and Intermod (almost
adjacent channels) (most assuming a 45 Mhz IF) have minimum seperation
distances specified by the FCC.

Add on top of that two things. Repeater/Translators for poor reception
areas, and the recent community low power TV activity (which is still up
in the air, and hasn't come down yet), and the spectrum looks a little
crowded. Not to mention the TV broadcasting is worth big $$$.

I'm not sure what a non-conductor would have to do with propagation problems.
In the normal case, your antenna is next to a large body of (non-conducting) air
when you transmit, and that doesn't seem to cause too many problems. Why would
water?

I too wondered about the Navy ELF project and it's effect on the 'black hole'
phenomena. I think these problems may have dated back to before that antenna
network was even thought of, though. Still, you have to wonder if the powers
that be thought about all that iron before they started digging trenches for
their antenna grid. Is it finished yet? Last time I was in the UP, the
environmentalists were still fighting hard.

2658. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-05-05 20:53:07 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9005060703.AA12026@ucbvax.Berkeley.EDU>
Source record: 11873

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

2659. ARRL DX Bulletin #18

Newsgroup: rec.ham-radio
Date: 1990-05-05 20:57:10 UTC
From: oo7@ut-emx.UUCP
Message-ID: <29536@ut-emx.UUCP>
Source record: 11861

(posting this for Jim Reisert AD1C):

QST de W1AW
DX Bulletin 18 ARLD018
>From ARRL Headquarters
Newington CT May 4, 1990
To all Radio Amateurs

Thanks to Paul, KB1BE and the Connecticut DX Association for the following DX information.

>From the DXCC desk. Do not submit QSL cards for Walvis Bay before June 1. Cards submitted before that date will be returned with no credit. DXCC credit for Walvis Bay will be given for contacts on or after September 1, 1977.

Spratly. 1S0XV The Russian group is still active. They are waiting for a new generator as well as additional fuel. They should be back on the air by May 4th and operating for about 10 days. The QSL route is still in question, but it is possible that a stateside manager is in the works.

South Yemen. A very good possibility for an operation on May 19th with 9K2 operators. They have received verbal permission and written permission is expected soon. Keep your fingers crossed and your radios warmed up.

Conway Reef. 3D2 Another mid May DXpedition to the South Pacific by part of the recent Jarvis team of Martti, OH2BH, Wayne, N7NG, and Ron, ZL1AMO. They will be joined by Matt, SM7PKK. These DXers, with good conditions, could really do a big job on the recently new DXCC country island.

Rotuma. 3D2 Bing, VK2BCH, will make his third visit and amateur operation from Rotuma in the South Pacific starting on May 20th. Bing will operate 80 through 10 meters using mostly SSB with some CW. QSL to his home call.

Cocos Keellng Island. VK9 May 19 to 26 operation of VK9EW by WC5N, and VK9WB by W5EW.

Dodecanese. SV5 Starting May 21st for 10 days, N2OO, WA3TYF and SV0AA will sign /SV5. They will also be in the WPX CW contest and will be active on 160 through 10 meters on both CW and SSB before and after the contest.

Kerguelen Island. FT4XG, Francois, has been very active on 10 SSB on the weekends. Listen on 28574 KHz around 1500Z working 5 up. Also, FT5XH and FT5XA show up on 14165 KHz several mornings a week at 1100Z or later via long path. QSL for FT4XG via FD1ASS or F1ASS or to 1990 CBA.

USSR special event station. Ian, G3BWN has been given permission to operate a special event station in Moscow operating from May through 12. His call will be EK45WV/G3BWN. Ian will also operate as UA3/G3BWN from the home station of the local radio club president. The special event station will be operated by local war veterans and Ian. Ian was a radio operator during WW2 on the Russian convoys. The WV in the call stands for War Veterans. The special event will be on 20, 15 and 10 meters, both CW and SSB.

Amiga Video Terminal is a software and hardware product for Amiga computer by AEA. It can do SSTV in colour, rx WEFAX, NEWSFAX, group 1,2 fax,over phone sending and receiving pictures w/many image processing utilities, it can be hooked up to phone line, transceiver etc. (it is a kind of modem).

I read it in QST and talked to a ham today at an Amiga dealer looking at the the brand new demo unit of Amiga 3000! (M68030/68882 25Mhz, 8 VLSI custom chips and the new OS is very professional). check out the comp.sys.amiga(.tech/.hard-ware) on usenet. He uses the AVT above and he likes it a lot, sending color SSTV on HF all over!

> on 6841 kHz, simulcast on 5050 kHz. The YL, EE announcer goes through a
> few minutes of "1 2 3 4 5 6 7 8 9 0" before going into her 3/2 numbers
> routine. What makes me wonder is the incredible signal strength I receive
> here in Boston. IT ALMOST OVERLOADS MY RECIEVER WITH THE ANTENNA UNATTACHED!
> This station is not coming from Cuba, but most likely from someplace in the
> New England area.

This station is located on 6840 kHz, and its parallel on 5047 kHz. It's a classic computer generated 3/2 format English Numbers transmission which has been positively located on a National Communications System site in the Warrenton/Remington area of Virginia. This determination was made some years ago and has been detailed in several publications.

This station is heard at regular four hour intervals throughout the daylight hours with excellent signal strength throughout the northeastern United States. The earliest known interception has been at 1500 UTC, with additional loggings of this station at 1900 and 2300 UTC.

The format (as described in an article I published this month in The A*C*E Bulletin) follows:

Type Five Transmission Formats (3/2 English)

"361" (repeated three times)
"1234567890"
(This header, consisting of the identifier and the
count from 1-0 is repeated for a full five minutes).
---------- (10 electronic tones)
"Count xx" (Repeated twice - corresponds to group count)
"xxx xx xxx xx . . . (Cipher text or crypt)
"Repeat"
"Count xx"
"xxx xx xxx xx . . . (As above)
"End"

You'll never find any 'sins of omission' with transmissions of this type. They are perfectly timed, well modulated, brisk and utterly bionic. While 5-D Spanish are often so technically inept as to be amusing, there isn't a

single hair out of place with this group.

The cadence moves like this - 123.45..123.45..123.45.. where '.' equates to a pause equivalent to the spacing between the numbers. So if you were to pace it through, each group of 3/2 numbers when combined with its spaces yields a count of 8 - one full 3/2 set with its spaces occupies an 8 second block. [As published in The A*C*E Bulletin, a publication which focuses on Pirate, Clandestine and Covert Radio, Numbers Stations and other similar topics].

Another National Communications System site, located in Miami, was the subject of a recent Popular Communications article about KKN-39 - another of those stations we'd all like to know more about.

Best -
/HM

Is there any digital use allowed on CB channels? I am think about
packet radio....not RC stuff for cars. And what channels can you use
for it?

Get a Radio Direction Finder......find where the signal is comming from.
Or just call the FCC....That is their job they should be able to find it.
I am now moving so I don't have my radio set up....so I can't see
if I get it in Hartford, CT.
I know there are other number stations that the FCC has tried to find
but there were not in the US....so they could not go after the people.

To quote from Telecom Cellular's (part of Telecom Corporation of New
Zealand, the still government owned but probably not for much longer
NZ-wide telephone company) brochure "All the facts about cellular phones
and how they work":

How private is a call on a cellular phone?

A cellular phone is virtually as secure as your normal phone.
If you would normally have a scrambler, you should also use one
with your cellular phone.

But of course people don't usually listen to a tapped wire "over a few
beers", do they? There are a few people running around out there with
scanners, and in NZ, a scanner that goes to 800MHz is expensive, but not
vastly so; quite a few people have them. The radio regs in NZ make it a
crime to act on or relay radiocommunications not intended for the
listener, but it's an awful difficult thing to prove.

2666. virus from Japan, affecting Sharp pc

Newsgroup: rec.ham-radio
Date: 1990-05-06 06:05:02 UTC
From: rfc@briar.Philips.Com
Message-ID: <94379@philabs.Philips.Com>
Source record: 11871

I don't know if this Sharp X68000 is an IBM pc clone, so the following may or may not be significant.

copied from Amateur radio packet:

Msg# TSF Size #Rd Date/Time MsgID From To
25681 BF 3274 0 0503/1054 13249_NA2B N2IXL VIRUS@NYNET ()
Sb: Virus in Japanese Software

RELAYED BY N2IXL, FROM BITNET (VIRUS-L DIGEST):
From: Yoshio Oyanagi <oyanagi@is.tsukuba.ac.jp>
Subject: Virus found in Japanese game software (Sharp)
VIRUS FOUND IN A JAPANESE GAME SOFTWARE ON THE MARKET
Yoshio Oyanagi

University of Tsukuba, Japan Newspapers reported on April 24 that a virus was found in a simulation game software "FAR SIDE MOON" (9500 yen) for Sharp personal computer X68000. It has been sold by Artdink Inc. since April 13 in Japan. The virus was detected by Computer Virus Institute (Takao Yamamoto, director) of Federation of Japanese Computer Clubs. According to Yamamoto, this virus is programmed so that it keeps inactive until July and after that data on floppy or in the computer will automatically be erased whenever one switches on the computer. So far 3000 sets have been sold, among which half are contaminated. It is conjectured that the computers in Artdink Inc. are invaded by the virus while developping the game software. Today (May 2) Asahi Shinbun (one of the major daily newspaper in Japan) disclosed that it succeeded in making contact with one of the virus makers. According to the report, the maker is a high school boy of age 17, who lives in Kagawa prefecture. Forty people collaborated in making the virus and got several tens of thousand yen (several hundred dollars) for each from the client, who ordered through PC network for hackers. The virus program was completed in three months and distributed secretly since last September. Federation of Japanese Computer Clubs told that there have been two viruses (viri?) for X68000, named "Namba I" and "Namba II". "Namba I" becomes active on July 4 this year and it deletes data on the computer or foppy disks. If the computer is contaminated with both "Namba I" and "Namba II", some X68000 do not accept any floppy after 0:00 May 2. The federation has developped a vaccine and distributing it among PC shops and users. If, however, a computer is contaminated with both viruses, it does not even accept the floppy disk of the vaccine. In this case, user should bring the computer to the maker and ask to change the parts.

2667. Kenwood TH-215A Problems

Newsgroup: rec.ham-radio
Date: 1990-05-06 07:02:08 UTC
From: nfunamura%mis2.decnet@NUWES-LLL.NAVY.MIL
Message-ID: <9005060701.AA11640@ucbvax.Berkeley.EDU>
Source record: 11872

In Message-ID: <1990May2.130539.3645@maverick.ksu.ksu.edu> Myron A. Calhoun writes:

<In a sample population of about 60 amateurs in this town, three of us
<own Kenwood TH-215A HT's, all purchased separately at different times
<from different sources....

<ALL THREE have developed an audio problem in the last eight months:
<the audio (both from the microphone and from the keypad) simply
<disappears at unpredictable intervals. And all three can be "fixed"
<by WHACKING the HT with the palm of one's hand--until it happens again.
....
<If your TH-215A has this problem, if you know of someone else whose
<HT has this problem, or if you know how to solve it, please let me know.
<One of these days a WHACK isn't going to work, and we need help!
<--Myron.

I have a TH-215A that had similar problems....and fixes. I don't know if I was also losing the keypad tones but the audio, both send and receive was dropping out as described. It first started out with losing the receive audio, then some time later I got some reports of no audio on transmit. I also experienced intermittent loss of power (everything off and nothing on the display). The fix was as described....a WHACK!
The first time I experienced the problem was when the rig was about a year old. I was able to fix it by re-soldering the connection on the jacks. I found cold solder joints on two of the three jacks (speaker and external mic). For some reason (maybe related to the large mounting holes on the PC board), the jacks appeared to be hand soldered.....with large globs of solder. Everything else appeared to be machine soldered.
The next problem I had was with the power jack. The rig would intermittently just lose power. In some cases I could fix it with a whack and in other cases it required running a thin non-conductor into the jack and pushing on the wiper arm on the side of the jack. I later changed the jack. The new jack lasted about a year and has now been changed also.
About six to eight months ago I began having problems with the audio out again so I quit using the speaker mic until I could change the jack. I have now changed both audio jacks and am back on the speaker mic. I expect to continue getting this problem about once a year so when I ordered the parts from Kenwood I bought three of each jack. (Not a good solution but trying to be practical...and keep the rig going).
I think the coiled cord on the speaker mic subjects the jacks to too much tension so I now run the cord under the rig to relieve the tension on the jack. The molded double plug configuration of the speaker mic does not help the situation (causes a rotational moment and pressure on one jack). I think that the biggest problem with all three of these jacks is that they cannot

withstand heavy/rough use.
I don't know how Dr. Calhoun or his friends use their rigs, but my problem has been mainly related to using it in my car. I don't think that anyone who strictly uses the rig on battery power and the internal speaker and mic would experience nearly as much problems as I have. However, I think that the problems would still occur to a lesser degree. The smart thing to do if the jacks are not used is to use the rubber jack-covers supplied with the rig. (Kenwood trying to tell us something?) This reduces the chances of contamination of the normally through contact on the jacks. (The suspected problem area is the normally through contacts on the jacks not making a good contact and being shocked back into contact when whacked).
It might be interesting to survey the number of people who have/have not experienced the problem and find out what percentage use the rig in their cars...with speaker mic, external power etc.
I have also heard of people having problems with the push-to-talk switch on this rig. It might be noted that the monitor switch (next to the PTT switch) uses the same switch and can be used as a replacement...if desired.

* STS-35 NEWS *
==============
Highlighting mission STS-35, the 36th flight of the
Space Shuttle and 10th mission of orbiter Columbia, will
be around-the-clock observations by the seven-member crew
using the ultraviolet astronomy observatory (Astro) and
the Broad Band X-Ray Telescope (BBXRT). Both instruments
are located in Columbia's payload bay and will be
operated during 12-hour shifts by the crew.

Liftoff of the 10th flight of Columbia is scheduled
for 12:45 a.m. EDT on May 17 from launch pad 39-A at the
Kennedy Space Center, Fla. Columbia will be placed into
a 218 statute (190 nautical) mile circular orbit,
inclined 28.5 degrees to the equator. Nominal mission
duration is expected to be 8 days 19 hours 55 minutes.
Deorbit is planned on orbit 139, with landing scheduled
for 8:40 p.m. EDT on May 25 at Edwards Air Force Base,
Calif.

Columbia's middeck will carry the Shuttle Amateur
Radio Experiment (SAREX) to communicate with amateur
radio stations within line-of-sight of the orbiter in
voice mode or data mode. This experiment has previously
flown on STS-9 and STS-51F. Also on this mission,
Columbia will function as the subject for ground sensor
operations as part of the Air Force Maui Optical Site
(AMOS) calibration test.

Commander of the seven-member crew is Vance Brand.
Pilot is Guy Gardner. STS-35 is Brand's fourth trip to
space. He previously flew on the Apollo-Soyuz Test
Project mission in 1975. He also commanded Shuttle
missions STS-5 in November 1982 and STS-41B in February
1984. Gardner previously piloted STS-27 in December
1988.

Mission Specialists are Mike Lounge, Jeffrey Hoffman
and Robert Parker. Lounge previously flew on STS-51I in
August 1985 and STS-26 in September 1988. Hoffman flew
as a Mission Specialist on STS-51D in April 1985.
Parker's previous spaceflight experience was STS-9 in
November 1983.
```

Payload Specialists Ronald Parise and Samuel Durrance
round out the STS-35 crew. Both are making their first
space flights.

* STS-35 QUICK LOOK *
====================
Launch Date: May 17, 1990
Launch Window: 12:45 a.m. - 3:09 a.m. EDT
Launch Site: Kennedy Space Center, Fla.
Launch Complex 39-A
Orbiter: Columbia (OV-102)
Altitude: 218 statute miles (190 nm)
Inclination: 28.45
Duration: 8 days, 19 hours, 55 minutes
Landing Date/Time: May 25, 1990, 8:40 p.m. EDT

Primary Landing Site:
Edwards Air Force Base, Calif.

Abort Landing Sites:
Return to Launch Site -- Kennedy Space Center, Fla.
Trans-Atlantic Abort -- Banjul, The Gambia
Abort Once Around -- Edwards AFB, Calif.

Crew:
Vance D. Brand -- Commander Red/Blue Team
Guy S. Gardner -- Pilot -- Red Team
Jeffrey A. Hoffman -- Mission Specialist 1/EV -- Blue Team
John M. "Mike" Lounge -- Mission Specialist 2/EV2 -- Blue Team
Robert A.R. Parker -- Mission Specialist 3 -- Red Team
Samuel T. Durrance -- Payload Specialist 1 -- Blue Team
Ronald A. Parise -- Payload Specialist 2 -- Red Team

Red Team shift is approximately 10:30 p.m. -- 10:30 a.m. EDT
Blue Team shift is approximately 10:30 a.m. -- 10:30 p.m. EDT

Cargo Bay Payloads:
Ultraviolet Astronomy Telescope (Astro)
Broad Band X-Ray Telescope (BBXRT)

Middeck Payloads:
Air Force Maui Optical Site (AMOS)
Shuttle Amateur Radio Experiment (SAREX)

SHUTTLE AMATEUR RADIO EXPERIMENT (SAREX)

Conducting shortwave radio transmissions between
ground-based amateur radio operators and a Shuttle-based
amateur radio operator is the basis for the Shuttle
Amateur Radio Experiment (SAREX).

SAREX communicates with amateur stations in line-of-
sight of the orbiter in one of four transmission modes:
voice, slow scan television (SSTV), data or (uplink only)

fast scan television (FSTV).

The voice mode is operated in the attended mode while SSTV, data or FSTV can be operated in either attended or unattended modes.

During the mission, SAREX will be operated by Payload Specialist Ron Parise, a licensed operator (WA4SIR), during periods when he is not scheduled for orbiter or other payload activities. At least four transmissions will be made to test each transmission mode.

Ronald A. Parise, 38, also will serve as a Payload Specialist. Parise is a senior scientist in the Space Observatories Department, Computer Science Corporation in Silver Spring, Md. He is a member of the research team for the Ultraviolet Imaging Telescope, one of the instruments scheduled for flight as part of the Astro payload. He is from Warren, Ohio.

Parise has participated in flight hardware development, electronic system design and mission planning activities for the Ultraviolet Imaging Telescope project. He is pursuing his astronomical research interests with the International Ultraviolet Explorer satellite under a NASA grant.

He received a bachelor of science degree in physics, with minors in mathematics, astronomy and geology from Youngstown State University, Ohio, and a master of science degree and a doctor of philosophy degree in astronomy from the University of Florida.

The primary pair of frequencies intended for use during the mission is 145.55 MHz as the downlink from Columbia, with 144.95 MHz as the uplink. A spacing of 600 KHz was deliberately chosen for this primary pair to accommodate those whose split frequency capability is limited to the customary repeater offset.

SAREX crew-tended operating times will be dictated by the time of launch. As a secondary payload, SAREX will be operated by Parise during his pre- and post-sleep activities each day. This means that wherever the Shuttle is above Earth during those operating windows, amateur stations can communicate with Columbia. Currently, those windows provide coverage for Australia, Japan, South America and South Africa.

The continental United States has little or no coverage except through a network of ground stations in other parts of the world in conjunction with relay links back to the United States.

Another part of the SAREX is the "robot," providing an automated operation which can proceed with little human intervention. The robot will generally be activated during one of the crew-tended windows and deactivated during the next one. This gives approximately 12 hours on and 12 hours off for the robot, with the operational period chosen to cover all of the U.S. passes.

SAREX has previously flown on missions STS-9 and STS-51F in different configurations, including the following hardware: a low-power hand-held FM transceiver, a spare battery set, an interface (I/F) module, a headset assembly, an equipment assembly cabinet, a television camera and monitor, a payload general support computer (PGSC) and an antenna which will be mounted in a forward flight window with a fast scan television (FSTV) module added to the assembly.

Antenna location does not affect communications and therefore does not require a specific orbiter attitude for operations. The equipment is stowed in one middeck locker.

SAREX is a joint effort of NASA and the American Radio Relay League (ARRL)/Amateur Radio Satellite Corporation (AMSAT).

STS-35 COLUMBIA SAREX FREQUENCIES

Shuttle Transmit Accompanying Shuttle
Frequency Receive Frequencies

Group 1 145.55 MHz 144.95 MHz
145.55 144.91
145.55 144.97

Group 2 145.51 144.91
145.51 144.93
145.51 144.99

Group 3 145.59 144.99
145.59 144.95

Group 4 145.55 144.95
145.55 144.70
145.55 144.75
145.55 144.80
145.55 144.85

Note: The 145.55/144.95 combination is in both Groups 1 and 4
because alternate uplink frequencies from Group 1 would be
used over North and South America while those from

Group 4
would be used generally in other parts of the
world.

2669. MFJ 1278 Multilevel Fax Format and notes

Newsgroup: rec.ham-radio
Date: 1990-05-06 20:31:43 UTC
From: paulf@jessica.Stanford.EDU
Message-ID: <9334@lindy.Stanford.EDU>
Source record: 11875

The MFJ 1278 8 level grayscale fax capability isn't terribly well documented (for that matter, even the 4 level docs are lousy). Here's some info for those of you who want to implement software:

1. Sync detect. At the beginning of a transmission, fax stations send about 20 lines of black ('o') with sync bars ('0'). The sync bars are roughly 14 characters (28 pixels) wide; I sync on the middle of the sync bars.

2. As one would expect, data is packed two pixels per byte, offset by 48d.

3. Assuming that you include the sync bars in the picture, the frame format is 607x1200 for WEFAX. Unfortunately, the clocking is a bit off, and you need to cut off one pixel at the end of every other line (eg, they're really sampling at a rate of 1215 pixels per second). The images are actually 600x600, so you need to compress the y-axis by a factor of 2.

4. Your software must be capable of an average throughput of 6kbps if you can do xon/xoff flow control, or minimum 6kbps without flow control. MacKermit, for example, can keep up, but only if you have xon-xoff flow control set.

5. The results are well worth it. I have some sat pix that I've downloaded and converted to GIF using pbmplus and some simple routines I've written; the quality is far better than commercial wxfax marine units. It works suprisingly well even in a fading environment.

From: noel@ubbs-nh.MV.COM
Message-ID: <4383@ubbs-nh.MV.COM>
Source record: 11630

Just picked up a couple FT-470's for myself and the spouse who just got her ticket a few weeks ago (N1HMW).

I really like the radio and am curious if it has additional capabilities.

To make a long story much shorter, if you have any mods or other information concerning this piece of equipment I would appreciate hearing from you and/or receiving it.

Thanks!
Noel

2671. More Questions and a Couple of Comments

Newsgroup: rec.ham-radio
Date: 1990-05-07 02:50:49 UTC
From: DXANDY@WIDENER.BITNET
Message-ID: <5A0506150428006E-MTABWIDENER*DXANDY@widener>
Source record: 11629

Hello All!
I would like to thank everyone who replied to my last batch of questions. Your advice was invaluable. I have another couple of questions that I would like to ask. I got a lot of replies from people who thought that the Kenwood TS-440S with the automatic antenna tuner was probably the best buy. When I buy a linear amp, I assume that I can no longer use the tuner in the rig since it can only handle 100W and it will be in the wrong place anyway. I am right?
My other question reguards satelite operations; I read an article in the ARRL handbook about using the OSCAR satelites and it sounded very interesting. The information was a bit out of date and it didn't mention whether there were any satelites in geostationary orbit. What kind of equipment is needed to track satelites that aren't in a geostationary stationary orbits; and is this easy to do?

And now for the promised comments! I have read a lot of postings from hams concerned about the future of Amateur Radio. There is a lot of talk about the "no-code" license to encourage new hams to get on the air. I don't think this will have that much of an effect. I don't think Morse is that hard to learn, all it takes is a little time. I think the biggest factor stopping people from becoming hams is that most people have absolutely no idea what Amateur Radio is.
Both the ham stores in my area are not easy to find. So noone will just stop by just have a look, because you can't see them from the road. You very rarely see any mention of Amateur Radio on the television. I think that if Amateur Radio had a higher public profile, then there wouldn't be the need for lowering the standards to get more people interested.
Another thing that concerns me is the volume of insults that see to fly around airwaves at various times. For some reason, most of this seems to go on on the 20m band (I don't know if it is me, or whether it happens on other bands and I haven't noticed). This cannot do the service any good at all. If you want to attract people to the service, then there has to be a serious effort to curb this kind of behaviour.

Andy Greenshields [dxandy@widener.BITNET]

The TH75 mod is pretty easy to perform. It might help to have the
service manual handy to reference against the board layout diagrams on
page 54.

Remove the front panel of the radio by removing the two screws next to
the PTT switch, one screw on the opposite side of the radio, and the two
front screws of the battery plate. Looking at the inside front cover,
the lithium battery is at the top and the CPU just below that. Near the
bottom left corner of the CPU is a short jumper wire. Using this as a
reference, locate two surface mount diodes directly above the wire on
the board. They are d3 and d4 from bottom to top.

```
D4 ---| cpu
D3 ---|
jumper wire> |____ ---------
W1 |||||||
```

D4 connects to the second pin from the bottom on the left of the CPU.
- Remove d4.

- Also cut the jumper wire. It's labeled W1 in the service manual.

This will give receive and transmit capability over the entire VCO
locking range; 136 to approx 168 on 2M, and 385 to approx 455 on UHF.
I did not try re-tuning the VHF VCO since that range seemed sufficient.
On UHF though, I moved the range upward on my radio to cover from 430
to 473MHz; a little bit more useful segment. Getting to the VCOs to
tweak on them is a bitch though, and I do not recommend trying it
without the service manual. You will find also that you'll want to
re-align the UHF front end if you plan on any serious work above 455MHz.
The radios come tuned for the 430 to 450 range, and as such, sensitivity
dropped to worse than 10uV at 460MHz. A little tweaking on L242 and
L243 band pass filters solved that problem.

Happy out-of-banding!

Brent Jones, KB1UK (former KC4AAA)

Don't know if there's an index on the net but what you want is real ancient history. I did some grinding back in the 50's to get a couple of rocks into the Novice bands (we use to be limited to Xtal control and 75 watts dc input then)!

I assume you have some FT-243 crystals or the old Blailey mounts in mind; these hermetics are a bear to work on, particularly the HC-18's and the little watch bar blanks. The mounted rocks are the easiest to work on, the hermetics usually have the electrical contacts plated on so you can't make them go very far. You mostly take material off a crystal, that makes the frequency go up. You can put a little pencil lead on to bring the frequency down but that usually ruins the stability and can "wear-off" after a while. In any case the activity often suffers from any work you do on the blanks.

If you are still of a mind to do this kind of work here is what I know. (damn little compared to some of the old masters)

Materials:

a piece of FLAT 1/4th inch plate glass 9" x 9" is a good size
some carborundum or diamond dust, grade 600 or 1200 grit is best
distilled water
solvent alcohol
a cookie sheet
several small cleaning dishes
a CLEAN place to work

Procedure:

Remove the blank from the mount. For the FT-243 holders this can be done with a small screw driver. Take note of the assembly sequence so you can remount when needed. For the hermetic rocks you first unseal the can at the evacuation hole using a small soldering iron then unsolder the can around the base; be careful not to crack the base.

For the plane blanks you can grind the face but for the plated blanks as are more common now you have to grind the edges. The difference here is that you can move a blank further by grinding a face than you can by grinding the edges. If you are working with plane blanks and only need to move it a few hundred hertz then try cleaning the blank first and remounting it before you go to work, make note of the starting frequency and ending frequency. To clean, first rinse off in the distilled water and blow dry, then a couple of dunks in the alcohol and dry again. If you have access to an utlrasonic bath these are great for cleaning. One thing to mention is once the blank is clean DON'T TOUCH it with your hands. I guess you could use CLEAN rubber gloves or a pair of tweezers with a bit of neoprene on the tips to handle the blank. The reason for cleanlieness is that any dirt on the blank will lower the frequency and reduce the activity of the crystal.

As you reassemble the blank and holder (you did clean the holder too didn't you?) you can move the frequency by changing the spring tension of the holder though don't try to move it too much.

Now comes the real messy work. To really move a crystal blank you need to take material off the blank or put it on. Make a few pencil marks on the surface of the blank near the center to lower the frequency. Grinding material off the blank (face or edge) raises the frequency. Make a slurrey of the grinding powder and water, some people use a bit of "terps" to keep it from drying out. Put about 1/4th teaspoon of powder on the face of the plate glass and add a couple drops of water and mix to form a light paste about the consistancy of tomatoe soup or a little lighter.

If you are grinding the edges then determine the current angle of the edge and try to keep the blank at that angle all during the work. The plated blanks have usually been touched a bit and so have a flat spot on the edge, work there. Use straight strokes through the slurrey which you have spread thinly over the working area of the plate glass. Maintain constant pressure and angle while you work. Stroke parallel to the edge of the blank. After a 5 or 10 strokes on the edge clean up the blank and remount the crystal to check how far you've moved the frequency. Do this a few times until you know how many hertz per stroke you are getting out of this blank. Each blank will move at a different rate so forget about any rule of thumb.

Now if you are bolder you will be grinding the face of the blank. You need to work out how to hold the blank flat and parallel to the surface. A small piece of plate glass about 2" square will probably work. Spread out the slurrey with one face of the small holder glass, get things as even as you can. You may need more slurrey to evenly cover the holder glass. You don't want too much slurrey, only enough to be about as thick as the blank. Place the blank in the center of the slurrey, put the holder glass on top and maintaining even and ballanced pressure on the holder glass (try using a pencil eraser in the center) drive the holder glass and blank in circles to grind the blank down. Again start off in small steps, check your progress frequently and clean the blank and holder well. If you notice some loss in activity then reclean the blank, if that doesn't bring

it back to life then you are probably getting the blank off axis. It's best to give up on a blank which has lost much activity as it will be darn near impossible to get it back on axix.

Anything else is cut and try, go find a real OH (some one from the the time before RF transistors) and see what they have to say about crystal grinding. I've got a fairly extensive collection of QST, CQ, 73 and Ham Radio (latter 3 from the first issue, QST back to 1928) I don't remember a lot of detail on grinding crystals, what I know I picked up from my Dad (licenced in 1919) who was one of those guys who could do or fix **ANYTHING**.

Good luck

Ron Todd, K3FR the PATHFINDER guy

My guess is darned few, they don't even require Morse code for the First Class Boy Scout Rank anymore!! Can you imagine a couple of boys doing 7 wpm with a flag on a 5 foot pole? Hint: dots right, dash left and space down. My buddy (ex WV2LMQ) and I did it for the council scout-o-ramma, it takes a bit hustle but we could probably have done 13. I wonder if that would be an acceptable way for hearing impared persons to take the code test?

2678. Coherers

Newsgroup: rec.ham-radio
Date: 1990-05-07 15:32:00 UTC
From: Ed@ALDERAAN.SCRC.SYMBOLICS.COM
Message-ID: <19900507153227.5.ED@PEREGRINE.SCRC.Symbolics.COM>
Source record: 11652

Date: 4 May 90 22:57:34 GMT
From: usc!zaphod.mps.ohio-state.edu!uwm.edu!ogicse!blake!milton!whit@ucsd.edu (John Whitmore)

An old variation on a cat's whisker was a "coherer"; this was a glass tube with metal chips. When the rectification failed, one simply shook the tube to change the chips' contact points.

Coherers don't work by rectification, they work by cohering.

```
--------------------- <-glass tube
ant--o------|:.:.:.:.:.:.:.:|----o--gnd <-electrodes, connected to antenna
| --------------------- | .:.: iron filings
| |
\----battery---headphones---/
```

The loose agglomeration of iron filings in a coherer had a high resistance; an increase in current from the antenna would cause the filings to "cohere" and the resistance would drop suddenly, causing an audible click in the headphones. To detect the next signal, the tube would have to be tapped to loosen the filings again. Automatic decoherers were invented to help out: the increased current flow through the coherer would trigger a small solenoid which would tap the coherer, thereby setting up for the next pulse.

2679. Looking for 2m HT purchase advice.

Newsgroup: rec.ham-radio

As a newcomer to ham radio, I am looking for some advice on purchasing
my first rig, a 2m HT. I want to start with a couple-year-old used one
so I can start operating without shelling out the bucks for the
latest-and-greatest.

Features I know I want:
- Synthesized tuning
- DTMF pad
- Tone burst for repeater access
- At least a few freq. memories
- Power output on the high side of allowable range
- Rechargeable batteries with decent capacity and good replacement availability

What else should I look for? Could you suggest some models I should consider?
When I head to my first swapfest, I want to know something about what I'm
looking for. Thanks in advance!

Hi,
I am looking for a manual and / or circuit diagram for

a TRIO TR-2200GX FM TRANSCEIVER. I wounder can any body help?

The set I have is faulty and I'd like to get it working again.

Thanks

Sean Mac Suibhne

2682. Cordless Phone Monitoring in USA and GERMANY

Newsgroup: rec.ham-radio
Date: 1990-05-07 17:41:38 UTC
From: flash@lopez.UUCP
Message-ID: <1990May7.174138.28262@lopez.UUCP>

Cross-posted to: rec.radio.shortwave,rec.ham-radio

SAY *YES* To rec.radio.scanner (If it ever comes to a vote)

The topic of cordless phone monitoring is a bit controvercial. If you have any compunctions against evesdropping on your neighbors (legally, of course), skip to the next article.

On our local system, The Great White North UPLink (Public Access Unix), we not only have SIGS devoted to radio and scanning, but we have a cordless phone monitor SIG. Not everyone who owns a scanner will admit that they devote a lot of time monitoring 46-47 mHz for the pedistal transmitters of cordless phones, but I would say most folks with scanners have at least punched the range in just to see what is there.

With the addition of a good outside antenna (Like the CHANNEL MASTER 5094A) these signals can be picked up at distances over a mile, meaning that even in a small town you will get PLENTY of action on this band. In fact, you might find conversations stacked several signals deep during prime phone times.

Listening to cordless phone calls in the USA is still legal under the ECPA, from everything we have been able to determine. In fact, courts continue to uphold convictions for crimes committed over the cordless phone when a listener turns in a drug dealer, prostitute, or terrorist. (USE your own conscience, YOU have to live with yourself).

There are supposedly only 10 cordless frequencies in use here:

46.61, 46.63, 46.67, 46.71, 46.73, 46.77, 46.83, 46.87, 46.93, and 46.97.

Looking at this list, you see the pattern, and notice that there should be operations on 46.81 and 46.91, if things were "true to form". Well SURPRISE, SURPRISE.... There ARE some cordless phones on these two frequencies! Not many, but they exist. Technically these are illegal, but the old style cordless phones also sometimes wound up in the amateur 160 meter band, also not legal, but they existed. (Note, there is STILL activity to be had on the 1600-1800 band, though cordless phones THERE use FM. Your ham tranceiver switched to FM will do just fine, though modulation levels seem quite low here. I have found ONE local phone on 1740khz, and this is NOT an authorized frequency either. These older style phones are no longer made, but show up at garage sales and Goodwill stores all the time.

The handsets operate in the 49-50 mhz range, but you only hear ONE side of the conversation on these frequencies, so they are not practical, although this is a way to find activity where the pedistal is in the

1600-1800 range (MF).

If you have a PRO 2004 or PRO 2005, a handy thing to do is to program a range from 46.61 to 46.97 as a permanent search bank. Your scanner will search the entire range in just over a second, and you have the advantage of picking up units that are not on the "approved" frequencies.

NOTE: Recently the FCC gave the go ahead to double the channel capacity by splitting the channels by 5khz (46.615, 43.635, etc).

So much for the good old USA.

You might be interested to know that there are cordless phones in other countries, but things work differently.

In GERMANY, it is illegal to own a 46/49 type cordless phone (the USA type), though MANY people there do use them. The legal cordless phone system in West Germany is quite complicated, and offers the scanner owner a real challenge. Instead of the 10 (or 12) frequencies we have here, there are 1,800 channels in potential use in Germany. A cordless phone there operates in the 931-976 mhz band (way up there!) with a channel plan of: XXX.X10, XXX.X35, XXX.X60, XXX.X85) (25khz spacing). The German phones "hunt" for a clear frequency, so the phone NEVER is on the same frequency twice for all practical purposes. Using 5 khz steps, it takes 5 minutes to scan the whole band, so you stand a good chance of missing conversations. 50khz steps mean you will MISS frequencies, and 12.5KHZ steps do not seem to line up properly for some reason. The phones also are known to SWITCH frequencies in the middle of a conversation, if the caller is quiet for a while.

German legal cordless phones can ONLY be obtained (rented) from the PTT. You can not "own" one, as you can here.

NOTE: In Germany it is ILLEGAL to monitor cordless phones. In GERMANY it is illegal to monitor anything. Scanners are verboten. However, in practice, there are enthusiasts who DO listen.

Perhaps someone with a 2004 or 2005 might have ideas on how to make cordless phone monitoring a bit simpler in areas where there ARE so many channels.

I am curious about cordless phones in other countries. What bandplans, legalities, etc. apply to other nations? Is the USA the only country where it is legal (so far) to monitor low power unlicensed cordless telephones?

No flames please. It is a legal hobby here, and sure beats TV soap operas!

I have an old Kenwood 7850. A friend was telling me about some
mod's to increase its frequency coverage (this request is asked
so often we should assign a number for this request, we could have
73, 88, and 51--extend frequency coverage :-) He also told me
about a fix to apply when replacing the finals (this is more serious).

He saw these in a newsletter from International Radio and Computer
of Port St.Lucie FL. Of course, he couldn't find which issues they
were in, he put the indexes in a _SAFE_ place... Anybody know of these?

PS: I am also looking for the Operator's Manual...

tnx

Source record: 11641

From what I've heard and read, I've put together that digital cellular will be or has been allocated spectrum in or around 1600 MHz. It will be purely digital and not compatible whatsoever with the analog system. Since the existing analog phones cannot operate on 1600 Mhz, compatibility is moot. I also understand that LA will be the first place to see digital cellular since it is now the most crowded, followed by the other major cities as financial resources come available. I have not determined if the present dual-provider requirements will be part of the 1600 MHz digital system.

I've also heard that there will be dual technology phones available, which will be, of course, much more expensive, so that the user can choose between digital and analog. You would need the analog side just to be able to travel to places that don't have digital. The analog service, even in LA, would continue to exist for 10 or more years beyond the introduction of digital cellular. Can you say "poor man's cellular"?

I am curious, as digital cellular starts to get going, if salesmen will suddenly start promoting the security aspects of digital over analog? If they do before digital is available everywhere analog is, then they will be admitting that some people don't have a choice but to use a secure cellular system. Since digital will be more expensive, they will need to push it in some way. In places like LA it might be easy enough to push as a service with available channels. I understand the situations is a mess there now, with cell full situations causing no call completion and failed hand-off's.

Subject: Re: Heriditary Hams...

"7 wpm with a flag on a 5 foot pole". The way to speed up that mode of transmission is to use a shorter pole. The speed is limited by the time it takes to move the flag which has very high air resistance. By shortening the pole you reduce the path length for the flag. I normally use a 3 ft pole with a 2x2 flag. That is a lot easier to move over an extended transmission. I have sent around 10 wpm without serious problems, but it required hams at both ends. If you make a transmission error, it takes a lot of time for 8 dits. Speed average is blown away. Also, the normal (old Boy Scout) protocol was an ack at the end of each word. That takes two people at the receiving end to keep up the transmission speed - one working the flag and the other copying. Then you have to use a slightly modified form of block ahead transmission - start the next word before the previous word ack is received. With a little practice, it works quite well. I would guess, however, that in practical use, 5 wpm is going pretty fast. It works when nothing else does, but it sure is easier to reach over and grab that HT.

Just for grins and giggles, I called ICOM this morning, to find out what was up with the shipments of the R1. The rep told me that, at the moment, ICOM was concentrating on filling back orders for other equipment, and as a result, production for the R1 hasn't been ramped up yet. She discounted the rumor about the patent lawsuit, and also told me that the R1 is currently selling in Japan.

Incidentally, I talked to Dick at AES, and he said that the level of interest in the R1 has been phenomenal...

What determines the top speed that you can copy CW in your head? Is it how your ears hear the interrupted pulse trains (mechanical) or is it how it's processed by your brain (software)? How about the inner ear (interface)? Why can some copy 60+ wpm and others only 30? Why doesn't practice make perfect? Or does it come down to the cold, hard facts that some people "have it" and others don't???

My old cub scout handbook said to use a safety pin and a piece of
galena (lead crystal). You probe the galena until you find a spot
that behaves like a diode.

How about a paper clip held down with a thumbtack and
probing an old penny?

I'd rather use a 1N34. :-)

Me too!

Not me. If I'm going though the trouble of making a crystal radio, why
use a 1N34? Might as well use a commerical radio.

The whole point of a crystal radio (in my mind anyway) is the hunk of
galena.

I plan to build a crystal radio, using state-of-the-art IC's for the
rest of the unit. However, I already have bought my galena crystal
(nice looking one too) at a rock-and-gem "show" (for a quarter not
counting the entrance fee -- I was going there anyway).

Haven't figured out the mechanics to hold the safety pin yet. What's
the optimum material for the pin?

Too bad the one I built thirty years ago (as a 7 or 8 year old) isn't
around anymore....sigh.... :-)

2693. SAREX Information And Operating Hints

Newsgroup: rec.ham-radio
Date: 1990-05-08 01:14:27 UTC
From: kd2bd@ka2qhd.UUCP
Message-ID: <289@ka2qhd.UUCP>
Source record: 11639
Cross-posted to: rec.ham-radio,rec.ham-radio.packet,sci.space.shuttle

SAREX-II is a secondary payload on STS-35, currently scheduled for launch on May 17, 1990. It will be located in the Aft Flight Deck of the Space Shuttle Columbia. Ron Parise, WA4SIR, the Payload Specialist and astronomer on Columbia will be the Astronaut ham operator.

SAREX-II-02 is a secondary payload on STS-37, currently scheduled for launch on November 1, 1990. It will be located in the Aft Flight Deck of the Space Shuttle Atlantis. Ken Cameron, KB5AWP, the pilot of Atlantis will be the Astronaut ham operator.

The American Radio Relay League (ARRL) is the customer on the SAREX-II payloads. NASA gave its authorization for SAREX operations for the following reasons:

To encourage our youth to become excited about science and technology, and

To familiarize large numbers of the general public with manned space flight

NASA's intent in making astronauts available for SAREX operations is to involve the largest possible number of people, particularly youngsters, in Amateur Radio and the US space program. With amateur radio clubs and hams, our astronauts will speak over amateur frequencies directly with large groups of students, showing teachers, parents and communities how Amateur Radio energizes youngsters about science, technology, and learning.

You can easily become a part of this activity in your local school, as the astronauts will operate the SAREX equipment in the amateur two meter band. You will be able to send and receive messages via packet for periods of about 12 hours daily. The astronauts' work schedules will determine your chances for a voice or television message, but Ron and Ken may have an hour or more each day for these modes.

The Johnson Space Center's Amateur Radio Club station, W5RRR, in Houston, Texas, will re-transmit astronaut's signals to WA3NAN, at Goddard Space Flight Center, in Greenbelt, MD (near Washington, DC), and to W6VIO, at the Jet Propulsion Laboratory in Pasadena, CA. These stations, plus W1AW and several VHF and UHF repeater groups, will re-transmit the signals on most amateur bands so that you and the students can copy the communications. You will hear NASA Mission Commentary, frequent bulletins to advise listeners of astronaut planned transmissions, and all amateur two-way voice and amateur television transmissions with the shuttles. Using a simple hand-held transceiver, you can open the world of science to hundreds of youngsters. Students themselves can take part in the shuttle flight via a packet

connection, and some will even be able to talk directly to the astronauts in orbit.

ARRL and AMSAT are co-sponsoring these exciting missions, with AMSAT heading up technical operations. Hundreds of Amateur Radio operators have already been working behind the scenes for months. The ARRL takes the lead with information and educational support. ARRL Educational Activities Branch (EAB) and NASA HQ will create lesson plans for teachers. All you need to provide is a 2-meter rig or a packet radio setup. If you are a teacher or instructor, contact ARRL EAB to get everything you will need and regular news updates. If you are a parent or a grandparent, contact ARRL EAB and a local school. EAB will send you materials, including ways to convince teachers and school administrators that Amateur Radio is an important discipline the school should take advantage of on a full-time basis.

This a tremendous opportunity for you to showcase SAREX 1990 and amateur radio to kids of all ages in a big way. Plan on being a part of it; contact ARRL EAB now and give your best to our exciting hobby and to our hope for tomorrow: America's youth.

Listen to the ARRL Bulletins on W1AW (see QST for CW and voice bulletins) on a daily basis; and to the AMSAT Nets on Tuesdays (U. S.), 3.840 MHz, 01:30Z to 03:00Z, and on Sundays (international), 14.282 MHz, 18:00Z to 21:00Z, +/- QRM.

[ANS would like to thank ARRL and NASA for this contribution. Stay tuned next week to the ANS bulletins for more details about the STS-35 mission and its amateur radio operations.]

The WA4SIR flight aboard the STS-35 flight of the Shuttle Columbia is still officially scheduled for early May 16th (GMT), although there are some hints that it might slip by one day. The SAREX mission will carry the packet ROBOT automatic QSO machine which will allow many amateurs around the world to have two-way packet QSO's with the Shuttle during the times when our ham astronaut, Ron Parise is busy.

To work the ROBOT, you transmit on 144.950 MHz and listen to the Shuttle on 145.550 MHz. Subsequent SAREX information bulletins will give you operating hints and describe the schedule in more detail.

If you are successful in making a two-way QSO, you call and your unique QSO serial number will be automatically logged and you will receive a QSL card after the mission. You will know you met all requirements of a two-way QSO by seeing your call in the QSL beacon which will be sent every 2 minutes and looks something like:

WA4SIR>QSL <UI>:
NI3F/186 WB2TNL/185 W3IUI/179 WB3AFL/177 NF3N/176 WA3EPT/175
N4QQ/174 W3IWI/172 JY1/153 U6MIR/127

If you are heard by the ROBOT, your call will appear in the QRZ beacon which will look something like:

WA4SIR>QRZ <UI>:
#3405-NE3H NI3F K1LNJ WB2TNL WB3ILO N3ACL N3FWX WA3TSD WA3USG
etcetera

where the #3405 is a serial number incremented every 2 minutes when the QRZ beacon is sent.

Unlike the QSL "worked" list, the QRZ "heard" list is not retained in the ROBOT and the laptop computer on the shuttle. In order to send SWL cards to those who were heard, it will be necessary to have amateurs around the world help to collect the list. When you are monitoring the WA4SIR SAREX transmissions, try to capture the beacons and send them in to us in machine readable format. We are only interested in the QRZ and QSL beacon information; please strip out everything else (like QSOs monitored, any other beacons, etc.). You may send it through the amateur packet network addressed like this:

SP SAREX @ W3IWI.MD.USA

or via the Internet addressed like:

sarex@tomcat.gsfc.nasa.gov

and make the Subject: field contain the date/time of the beacons like:

May 19 @ 03:42z

Here are several hints that may help you make a successful packet QSO with the SAREX ROBOT that will fly with Ron Parise, WA4SIR in mid-May.

1. Frequencies: Your transmitter uplink frequency should be 144.950 MHz and you should listen for the shuttle downlink 600 kHz higher on 145.550 MHz. Under no conditions should you transmit on the 145.550 downlink!

Since there may be other packet or voice activity in your area on these frequencies, local coordination to insure a clear frequency during the ten day STS-35 mission may be needed.

2. Modulation: The uplinks and downlinks are ordinary AFSK/FM 1200 BPS signals, just like most terrestrial VHF packets. No special modems are needed. You are advised to check your transmitter's FM deviation and set it to 3 kHz or less. Most radios are typically set to 5-6 kHz and this will be too wide because of doppler shifts. If you don't have a deviation meter, listen on another radio and crank the tone level down until you hear the volume drop noticeably. Most people run too much deviation on their packet signals anyway, and you will probably find this improves the reliability on terrestrial paths too!

3. When to hear/work the shuttle: During the mission Keplerian elements and predictions will be sent frequently by WA3NAN, W5RRR, W6VIO, and many local FM repeaters, as well as by packet bulletins addressed to @AMSAT. Check with your local AMSAT area coordinators for information in your area. In general in the USA, the windows are in the late evening and early morning hours. Don't expect the SAREX hardware to be activated until the second day of the ten-day mission. Because the inclination of

the shuttle orbit is only 28.5 degrees, the signals can only be heard between about +43 and -43 degrees latitude.

4. LISTEN!!!: Most packeteers don't listen to the BRAAAAP! from their radios, but you should listen during the shuttle activity. If Ron is personally available, he may turn off the SAREX packet hardware and be QRV on voice.

5. Connecting to the shuttle: All you do is to issue a connect. If you are heard, you will see something like this:

```
cmd: CONNECT WA4SIR
*** Connected to WA4SIR
#191--- Tnx QSO with the SAREX Shuttle "ROBOT" automatic QSO machine
*** DISCONNECTED
```

When the ROBOT hears your "ack" of its transmission, it will disconnect and you will be in the log. Because the ROBOT queues information for 3 seconds and sends several replies in one transmission, you should set your DWAIT to about 4 seconds.

6. Multiple QSO's: Once you have worked the ROBOT and make it into the log, no further QSO's from you will be logged (even if you use a different SSID). Give others a chance and don't connect multiple times!

7. Monitor!!!: Every 2 minutes a beacon addressed to QRZ will list stations heard recently, and the QSL beacon will list those worked. Every 3 minutes the Metabeacon (up to 1.7 kbytes in 7 packet frames) addressed to QST will send text describing shuttle activities. Monitor these beacons to keep informed. In Bulletin #1 we ask for you to submit copies of the QRZ and QSL beacons you copy.

8: Your chances for success: Signals from many hundreds of stations can be heard from the shuttle. With FM transmissions, only the strongest signal "wins", just like in a DX pileup. To help, the ROBOT can have up to 9 QSO's in progress at any one time. Perserverance and a well equipped station will help -- but if activity levels are high and the uplink channels are busy, it will be a matter of luck.

>production for the R1 hasn't been ramped up yet. She discounted the rumor
>about the patent lawsuit, and also told me that the R1 is currently selling
>in Japan.

I talked to someone at EEB, and he told me that ICOM was recalling all scanners
and EEB was pulling their ads because of a "patent problem". This he said
was the unofficial reason. He said the scanners were still available outside
the country. He seemed to indicate that there was a real reason the radios
weren't available any more and a official reason that they were told to tell
customers. Eather ICOM is giving you some BS or this guy was giving me the
run around.
I also called Grove Enterprises and they confirmed that ICOM was no longer
making the R1 available in the US.

Scanner Mods Magazine
You might try MONITORING TIMES. While not generally available on the stands, this magazine does --at times-- go into scanner mods in a limited manner.

You also might try Dromedary Techincal Services, 141, Jackson Road, Roopville, Georgia 30170. Phone: 404/854-8846.

Coherers; yes they need a mechanical shock to restore the high resistance state. The Science Museum in London had a fine collection of these in the 'sixties. Some used metal filings, with a clockwork (yes, wound-up-spring!) mechanism that tapped the filings in the tube at regular intervals to de-cohere it. Another had a trembler mechanism like an electric bell, with the armature tapping the filings. There was also the 'mercury wheel' coherer - a metal disk mounted above a pool of mercury in a dish, so that the wheel just touched the mercury. A thin film of thin mineral oil was then put on top of the mercury -this formed an insulating barrier between the disk and the mercury. High-frequency voltages broke down the oil-film, so the device conducted. A clockwork motor rotated the disk slowly (so as to bring a new film of oil between the disk and the mercury and achieve 'de-coherence'.) I also have dim memories of a coherer using two metal balls separated by an oxide-film and mounted in an evacuated bell-jar; also i guess that bio-galvanic mechanisms could have been used: wonder what the DX record is for a pair of frogs legs?

I also had a problem as you described above.

What I did to resolve it was to turn down the volume, disconnect the audio-in
or set the DCD Threshold to a point where the CD light doesn't come on.

Then reinitialize the I/O.

Works every time for me. PK-232/MBX with PC-Pakratt.

I suspect that having active data transitions while it's trying to initialize
just blows their firmware's mind..

hope this helps
later

2702. Crystal shaving...

Newsgroup: rec.ham-radio
Date: 1990-05-08 13:21:55 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <08.May.90.14
Source record: 11657

One way to change the frequency of a crystal is to use chemical methods;
a solution of hydrofluoric acid will etch the rock (making it thinner so raising
the frequency) whereas it is also possible to plate materials onto the rock
electrolytically. This lowers the frequency by loading the rock.
Hydrofluoric acid is hazardous stuff; if i had any, i would run away quick!
I would not recommend using it, specially in unskilled hands. It dissolves
glass in a most spectacular way. Likewise human flesh, clothing etc.
Plating a rock is easy; use copper sulphate solution, 0.1 molar. Link both the
electrodes of the crystal together, and dangle the rock into a beaker of the
solution. Hang a copper wire into the beaker too, making sure it does not
touch the rock. Connect a variable-voltage power unit to the wire and rock
(anode is wire, cathode is crystal). Give it about 10 milliamps for a
minute or so, take the rock out, wash it in industrial alcohol to remove
any remaining solution, dry it off, then put it in circuit and see what
frequency you hit. Repeat this until you get the right frequency. Of course
if you go too far, you can reverse the polarity of the supply, and strip
off some of the plating. Beware though; activity falls as you increase
the plated-on loading, and cannot always be restored by the reverse-polarity
trick (because the plated-on material is not deposited evenly).
I shifted a HC6U rock from 7055KHz down to 7001KHz this way (i was
aiming for 7000KHz but could pull it the last 1KHz with the trimmer). It seemed
to still have reasonable long-term stability (drifted about 2KHz high
over 5 years).

From: mwester@waveguide.central.sun.com
Message-ID: <156@texsun.Central.Sun.COM>
Source record: 11670

I posted this question a week ago or so, but I don't think it made it out...

I'm looking for any thoughts/opinions/experiences with on-glass antennas and tinted windows. Specifically I have an Antenna Specialists 2-meter glass-mount and a Chrysler mini-van with the factory "sun-screen" windows. Has anyone tried this combination or anything similar.

I'm concerned because the antenna came off my Monte Carlo last year 'cause everytime I keyed up, the cruise control turned off. There was no way to mount the shoe on the rear window without straddling at least one defroster wire... the salesman claimed that it didn't matter, just center the shoe between two wires and it would work fine (so much for my faith in instruction manuals and salesmen).

I heard somewhere that some company makes an on-glass antenna that has a groove cut in the shoe to allow straddling the defroster wires... Does anyone have any idea who this might be?

Thanks,
Mike (KA9WSB) [mike.westerhof@Central.Sun.COM]

Back in the good old days, I got a half-dozen surplus crystals right at the bottom end of the 40 meter Novice band and ground them up using a piece of plate glass and a "slurry" of water and Ajax cleanser. This works OK if you are only trying to move the frequency 20 or 30 kHz, but it does tend to reduce crystal activity if you are not careful. The trick is to try to keep the two crystal faces exactly parallel -- in other words, try to make the grind as even as possible.

I had heard that toothpaste works well for crystal grinding. I could never make it work. Perhaps a "whiter than white" abrasive-type toothpaste would work better.

Good luck!

From: billt@hprnd.HP.COM
Message-ID: <1140030@hprnd.HP.COM>
Source record: 11660

One of the problems in making twin lead J poles is that not all twin lead is the same. Low loss twin lead has a different velocity factor and hence the lengths are different. If possible check out the J pole on a network analyzer to find out what its resonant frequency and impedance is.

Date: 8 May 90 00:22:56 GMT
From: zephyr.ens.tek.com!wrgate!copper!michaelk@uunet.uu.net (Michael D. Kersenbrock)

I plan to build a crystal radio, using state-of-the-art IC's for the
rest of the unit.

Well, gee, why not build a totally digital crystal set? For the detector,
you'll need an XOR gate, a flip-flop and about two feet of wire.
Connect one input of the XOR gate to a square wave generator at the carrier
frequency (Fc) of the station you intend to receive. Connect the output of the
XOR to the other input with the two feet of wire, arranged so that you can
vary the length of the wire. The output of the XOR gate will be very narrow
pulses at Fc. Connect the output of the XOR to the trigger of the flip-flop.
Adjust the two-foot hunk of wire until the flip-flop triggers about half
the time-- that is, make the pulses so narrow that they fail to trigger the
flip-flop half the time. By connecting an antenna to the trigger of
the flip-flop, you can let RF energy vary that triggering percentage, and
the output of the flop will vary with the instantaneous modulation on the
signal. Of course, you need a low-pass filter and audio stage; a small
speaker connected to an output of the flop will serve nicely.

Please note that the device described above does not meet
Part 15 specifications concerning spurious emissions.

> that behaves like a diode...

The crystal set that has been diagrammed in the Cub Scout handbook forever DOES NOT WORK because the sliding coil-tap makes shorted turns. Kits were even produced, and they didn't work either. I suspect the original author never tested it.

It's about time they published something workable, using available parts. There have been lots of excellent but simple crystal-set articles in magazines like _Popular Electronics_ since the '60s. Does anybody out there have connections with the BSA publishing establishment?

From: Pete_Simpson@dgc.mceo.dg.COM
Message-ID: <9005090029.AA00031@adam.DG.COM>
Source record: 11664

CEO summary:
I'd advise against using them for all but low power transmitters. I have had personal experience with one and it has a very narrow bandwidth, so the SWR rises very quickly as you change frequency. I also know a commercial radio dealer who tried them and then offered me the 5 remaining ones, free! His comments were along the lines of "burns up real quick," but remember, this was commercial gear with 30 to 100 watt output. The cellular guys seem to get away with them but they're only running a watt or two. Don't know how they get wide bandwidth...
(I punched a 3/4 inch hole in my roof and put in a Larsen NMO mount and a 1/4 wave spike...ran the coax down the front roof pillar to the radio. Done it that way in 3 Japanese cars. Power for my 25 watt rig comes from the cigarette lighter (I don't smoke) and the rig is installed where the ash tray used to fit.)
Whichever way you go, I'd suggest putting "anti-seize" compund (a greasy material with flakes of metal in it...available at auto parts stores) on all threads exposed to weather and on the whip element where it enters the clamping socket. Seals against water (and salt) getting in there and corroding the connection...thereby raising SWR. Silicone grease on all "o" rings, of course.

Another call to ICOM [(206) 454-8155] and the Amateur Radio Sales Rep was
made. Again, she she said that the problem was production, and that there
was no plan whatsoever not to market the R1 in the US.

>I also called Grove Enterprises and they confirmed that ICOM was no longer
>making the R1 available in the US.

Well, she also talked to Bob Grove, and he in turn relayed EEB's comments.
She has no idea what's behind EEB's move, and that she told Grove that they'd
be shipping Real Soon Now.

Calls to AES and HRO revealed no plans to stop marketing.

Doug, something truly strange is going on here. Somebody isn't telling the
truth; either EEB is hallucinating, or ICOM is full of it...

>.............................

In the Mid fifties we (high school kids using 1 tube transmitters) used
to grind FT-243 xtals up to the 40 meter novice band (7.15 to 7.20 MHz in
those days) from stock xtals in the 6.95 to 7.10 MHz range. As I recall,
all we used was a piece of window glass, some COMET or AJAX scouring powder,
and plain ordinary tap water.
We were told that grinding should be done in a figure eight motion to
assure an even grind, and also to try to only grind one side of the crystal.
The grinding table was the window glass which was prepared with a couple drops
of water on which the COMET had been sprinkled. We used the index finger
directly on the crystal (no separate glass plate). After grinding, the
crystals were washed and dried and from this point only handled by the edges.
I would estimate that our success rate was nearly 100% when grinding the
crystal up 50 KHz or less. The failure rate increased as the frequency
shift requirement increased. Also the crystal activity suffered and more
chirpy signals resulted. I don't think we were able to achieve a shift of
over 200 KHz with much luck. Anyway, don't ask me about stability of the

crystal etc. but it was good enough to get us on the air.
I'm posting not to dispute anything Ron has posted....There's a right way
and a not so right way....So if you have enough crystals, and want to get your
feet wet, jump in!

My call sign is a real turkey in Morse (WB9QLR) and little better on phone.
My first name, however, has a nice swing to it, since after the initial
double dah, it alternates:

_ _ · _ · _ · _ · __

Haven't run code in years, but thought I'd throw in my .02 worth. On top
of that, I can't think how many times people thought they heard an extra
dah on my last name and called me "Mary" - instant gender change :-)

I suppose that there must be similar circustances in a lot of other cities
in the country ie apparently only 1 or 2 UFH stations in town.
I also live in Rochester and have recently noticed a new rather weak signal
on the air on channel 38 signing W38AW. On questioning a few people locally
I find it is a new low power (less than 1,00 watts by FCC definition)
Commercial TV station. The local FCC people did not no a great deal about
them except that there are a large number of construction permits for these
type of TV stations already issued, and an even greater number of potential
applications pending. The stations according to the FCC are meant to have
a range of 10 miles, but must not cause interrference with other channels.

Anyway I guess the bottom line is that vast wasteland of UFH that appears
to be currently unused in many areas may be very soon be consumed by the
allocated users. All of this will undoutedly put an even greater pressure
on the Ham bands.

PS anybody have some more info on these low power TV stations ?

Geeee.... We were poor kids - we'd unsolder the cover on the crystal
can, take a number 2 pencil and put a mark on the crystal surface.
The added mass would change the resonance frequency just enough to
get us out of the Extra band or into it...

Source record: 11672

I was looking at an ad for the new AEA antenna ad in AES's latest catalog, and I'm slightly intrigued. It's another varient on the small capacitively tuned loop idea- just a loop and a big remotely tuned capacitor mounted on the roof (or tower, or whatever).

Has anyone played with this thing yet, or perhaps with other varients on the same idea..?

In a completely unrelated matter: I apologize in advance for asking on this list, but since I have run into a number of blind alleys and this group has so many educated technical types....:

I need a software package- micro (IBM, Mac) or mainframe (IBM), object or source, for monitoring our University's compliance with NRC license requirements regarding radioisotopes. It should keep track of who's got what, compute decay rates and so forth. I'm sure there's something out there better than the awful FORTRAN program someone wrote here 20 years ago...and I don't feel up to writing another one :). Thanks...

2724. Current 10 meter Propagation

Newsgroup: rec.ham-radio
Date: 1990-05-09 14:29:09 UTC
From: jta@hydra.Jpl.Nasa.Gov
Message-ID: <1990May9.142909.8701@elroy.jpl.nasa.gov>
Source record: 11785

WB6HQK, WB6ZSU, K6JRR, WA6CGR, myself and a few others are beginning to get our 10-meter-mobile plans ready for summertime vacations and driving, and we've got a couple of questions for those who regularly use 10 meters.

Since I hope that there'll be more than a few responses to these questions, please mail all response to

grian!puffin!wb6hqk@elroy.jpl.nasa.gov

You may also merely reply to this message and I'll forward the responses to HQK...

^L
**********10 Meter Propagation Survey**********

Please answer these questions based upon only your 10m experience of the past 12 months.

We are looking for specific information on achieved and predicted operation on 10m over a 100 - 2000 mile range zone.

For each question, please note any propagation differences between CW, voice (AM, FM, SSB) and packet operation.

The term "reliable" means at least marginal (or better) communications 50% of the time (in other words, the ability to exchange callsigns, signal strengths and locations during a short QSO).

1) How much power do you generally run on 10m?

2) How much power do the majority of your contacts on 10m use?

3) What type of antennas do you use for your various 10m operations?

4) During the daytime hours, what kind of range do you reliably expect and achieve on 10m?

5) During nighttime hours, what kind of range do you reliably expect and achieve on 10m?

6) For the upcoming 12 month period, predict a range over which a pair of 10m, 10-watt mobile installations could enjoy reliable communications.

Bonus Essay Question (10 extra points)

Given two to four hundred dollars and a 12-volt, trickle-charged
car battery as your power source, which of the current 10-meter
radios would you purchase and why? (Yes, you can spend the
money ONLY on a 10m radio...)

Thanks for your time. I will post a summary of the
information gathered via this Survey.

Brian,

At least in northern Colorado, you will want an HT with PL (subaudible tone) generation capability, NOT "tone burst". Many European (and a very few U.S.) repeaters require a tone burst on the front of a transmission (often 1800 Hz) to open the repeater. In this area, repeaters which are not completely carrier-controlled require a subaudible tone which is continuous during the duration of the transmission from the HT. This is sometimes used to implement "private" repeaters, but is coming into wider use as a means to control interference problems (unfortunately).

BTW, in used HT's, I'd go for one of the ICOM-02AT's, or a 2AT with an add-on PL generator. For a new model, I'd probably consider the Icom 2GAT for 2m only, or one of the new dual-band HT's (220 and 440 are both becoming more active in this area).

2728. Sunspot Cycle 22 - What's going on ?

Newsgroup: rec.ham-radio
Date: 1990-05-09 16:43:52 UTC
From: n2ic@druhi.ATT.COM
Message-ID: <4781@druhi.ATT.COM>
Source record: 11675

Many of you may have noticed the sharp drop in the solar flux this month (down to 121), and wondered what's going on with sunspot cycle 22 !

Are we headed back down already ? Will 10 meters be any good this fall and winter ?

By using solar flux data from the SESC (given to me by W1GD), I have examined the current sunspot cycle, and have tried to make some comparisons with the previous 3 sunspot cycles.

To examine the sunspot cycles, I have taken a 12 month running average of the solar flux numbers. I call this the "smoothed solar flux". This tends to damp out the day-to-day and month-to-month variations that confuse the issue !

Cycle 22 (the current cycle) rose monotonically until June, 1989, peaking at a smoothed solar flux of 214. The smoothed solar flux stayed at 213 or 214 from June 8, 1989, until July 12, 1989. From mid-July, until November, 1989 (the latest date from which a 12 month running average can be constructed), there has been a downward trend in the smoothed solar flux. The flux has been between 205 and 206 from September 12, 1989 until the most recent date (November 6, 1989). This represents a 9 point drop from the peak. Another way to look at the peak interval is to examine the interval of time that the flux was within 9 points of its peak value. For cycle 22, the smoothed flux was 205 or greater from April 17, 1989 until the "current" date of November 6, 1989 - an interval of slightly less than 7 months.

Now, a comparison with previous solar cycles:

Cycle 21 rose monotonically until April, 1980 (smoothed flux = 199), then dropped 3 points, then rose to a smoothed flux of 201 in October, 1980. Cycle 21 then dropped 6 points, before rising to the cycle peak of 204 in April, 1981. There was then a 4 point drop, followed by another cycle peak of 204 in September, 1981. Finally, cycle 21 dropped rapidly.

Cycle 21 was within 9 points of its peak value for an interval of 25 months.

Cycle 20 was bizarre ! There was no pronounced peak. The smoothed flux maximum was only 156. However, cycle 20 was within 9 points of its peak value for an interval of 40 months.

Cycle 19 rose monotonically until June, 1957 (smoothed flux = 233), dropped 2 points, then rose to 243 in December, 1957. Cycle 19 then dropped 2 points, before rising to the cycle peak of 245 in March, 1958. The flux fell rapidly following the cycle peak. Cycle 19 was within 9 points of its peak value for an interval of 9 months. However, cycle 19 had a smoothed

solar flux above 200 for 33 consecutive months !

Observations:

It seems that the higher the absolute value of the maximum smoothed solar flux, the more "peaked" is the cycle (a faster rise and decay).

If cycle 22 has already passed its peak, it will be remarkable in terms of the short length of time it was near its peak value. This tends to imply that perhaps cycle 22 has not yet reached its peak value.

On the other hand, cycle 22 has already dropped 9 points from its peak value. None of the other 3 sunspot cycles that I compared against had dips of more than 6 points before rising to the cycle peak. The 9 point drop of cycle 22 seems to imply that we are past the peak.

Conclusion:

The jury is still out on cycle 22. Only time will tell !

Well, folks it appears that the ICOM R-1 was either vaporware or just couldn't be sold in the U.S. The ICOM folks at Dayton said the radio has been "cancelled indefinitely" and EEB says that they may still get some someday. EEB said ICOM was citing "production problems" as the reason for cancelling the receiver.

What's interesting is that ICOM ran a back cover ad on the May issue of Popular Communications advertsing their new receivers. EEB (a major ICOM dealer) had also run ads for May, 1990. The people at EEB sounded really annoyed at ICOM for pulling this rig so suddenly. I sense a production yield or tariff problem here. I personally think the radios exist and they and they can't get them into the U.S.
This is a Stone Cold Bummer :-(:-(. I was really looking forward to that radio.

>.............................
>I assume you have some FT-243 crystals or the old Blailey mounts in mind;
>these hermetics are a bear to work on, particularly the HC-18's and the
>little watch bar blanks.
>.............................

A few postings about altering FT-243 crystal frequencies have been put up here. I and a few others also used the ajax cleaner method of raising the frequencies with some degree of success. However, being a little over eager we over-shot the desired frequency range a few times (i.e., made the crystal blank too thin) and had to lower the frequency. Another poster described how to lower the frequency of FT-243 blanks by copper plating. We were not that clever. Instead what we did was rub a piece of solder on the crystal to build up the thickness. We found this to work to a limited degree and was able to lower the frequency by 5-10 kHz (kilo-cycles in those days). Any more solder that that amount seemed to kill off the blank. As I recall we got the solder idea from a Hints and Kinks article in QST or a republished H&K booklet.

Anybody out there know what the community now calls these measures?
cps, kmc, mickey-mikes.

I'll post the answer in a day or two.

Cross-posted to: rec.ham-radio,att.ham-radio

I am using AC-1 active antena for my SONY-ICF 2010. Most of the time
I play around tuning to All India Radio stations. Ever since I installed
this active antena, the signal strength of AIR is touching the maximum
even in the afternoon. Here is the catch. I cut open the loop of the
AC-1 antena and connected it to a 60feet external antena(wire). Also
there is absolutely no distortion/static/overload. Also I could able
to tune to AIR home services.

Now, I would like to know whether by coupling AC-1 and the external antenna
blows out the front end of my SONY-2010 or any other side effects.

Meaning they sent it back to engineering to design out the patent conflict. There is no such thing as a production delay of such a long period in Japan. The Japanese definitely have their act together on the production line floor, stocking parts, etc. The guys who don't have it together at all are the American sales people.

Gee, if we all had access to a network analyzer, life would sure be
greatly improved. However, a network analyzer of the quality you would
expect from companies like HP and Tektronix are overkill for most
amateur needs. A "poor man's" network analyzer might be a nice
project or junk product for someone to make. It could be based on
a sweep oscillator and feed into a PC for memory zeroing. Complex
response would not be needed for many things, either. The PC software
could be customizable to do nifty stuff like a Smith chart.

Trouble is, if you build a crystal set, what is there to listen to
on it? Just junk.

<Old Pharte Mode On>

Now, in my day, laddie, from G-land, you could hear the good old Beeb,
as well as Radio Moscow. By suitable twiddling, you could also hear these
guys chattering away to each other late at night - turned out to be "hams"
or something. Nowadays the same old guys are chattering away, but it's
all this modern SSB stuff that you can't understand on a crystal set, and
the "AM" band is just junk. How's that going to turn anyone on to the joys
of DXing and similar fine pastimes? Grumble, grumble..

<Old Pharte Mode Off>

Anyone built the Radio Shack AM/ShortWave Radio (ages 2 and up)? I can
hear 2, or at most 3, stations on mine, the selectivity is nil. I dunno,
maybe it's all these modern transistor things etc - you never really know
if they're working or not. They don't light up or nuffink.

2738. No audio on Icom...general fixing things

Newsgroup: rec.ham-radio
Date: 1990-05-09 21:15:26 UTC
From: dube@cpdvax.csc.ti.com
Message-ID: <9005092117.AA27237@ti.com>
Source record: 11783

Jim Stewart asked if there was a book (or whatever) that covers problems
and the tricks to finding and fixing them.

Unfortunately, no one book exists that covers the full range of problems
one is likely to encounter in troubleshooting equipment. There are a lot
of periodicals, books, articles, etc. about locating those hard-to-pin-
down problems with TV's; and most of these come from guys with a lot of
experience with them. Many people keep a little "diary" in which they
list those "dog" problemsfor which some unusual repair was required.
Often, these rare problems/fixes apply only to one model or manufacturer;
and may be tried on other equipment when all else fails.

Troubleshooting faults in radios, nd TV's,
TV's, autos, and yes, even human bodies,
requires a fair amount of knowledge of the BASICS on which their systems
are built. You can get this from books, schools, etc. Further, good
fast troubleshooting also requires a knowledge of the equipment itself and
how it works---how it incorporates the BASICS you learned about in the
books and schools. Here is where the experience comes in. The most well-
read person who understands thoroughly the BASICS can't just go into a
complex piece of gear and find a fault. A study of how it works is in order.
By the rule of the Learning Curve, the more problems you deal with on a
particular piece of gear, the better you get at finding and fixing problems
with that gear. (Learning Curve = Experience).

Your own ability to keep your thoughts organized; to apply knowledge of past
problems and their fixes; and the knowledge of and ability to follow a logical
and methodical course of action are the catalyst that brings knowledge of
BASICS and knowledge of equipment together to solve the problem at hand.

Many people reading this will recognize that the general problem-solving
principles apply as well here as to determining why a product is losing
market share. Why did I stress BASICS? Simply because a knowledge of the
fundamentals is an absolute necessity without which knowledge of equipment
is almost a hindrance; and proper experience canl not be gained.

With a thorough understanding of the BASICS you can find and fix a problem
eventually on a piece of gear you've never seen before. Add a knowledge
of how it works, and you find and fix it faster. Now add a year's
experience on that gear, and it almost seems as if there is no problem.

Has anyone heard what frequencies will be used and what schedule will
be followed for ATV during the upcoming SAREX mission? I assume (hope)
it will be one of the 70cm ones, since that's where my DaveTV equipment
listens. Thank you in advance,

Considering the Japanese Patent Office finally granted Texas Instruments
a basic technology patent for inventing the integrated circut sometime
in the summer of _1989_ it isn't all that surprising that the rig could
still be selling in Japan.

(They also made the effective date sometime in the 60's so TI gets to
collect royalties for about four or five more years. I think the
Japanese courts awarded TI several tens of millions of dollars back royalties.)

I just received a Spring 1990 flyer from G & G Communications
that may interest scanner hobbyists.

The flyer lists hundreds of used scanner "carcasses" and
parts for sale, as well as pagers, ICs, and crystals.
It states:

"...Our specialty is scanner repair.
We will attempt to fix most any scanner with few exceptions.
The Bearcat 250s, 300s, and 210s that most shops
are unable to repair, we fix daily..."

You can get a flyer by contacting:

G & G Communications
9247 Glenwood Drive
Le Roy, NY 14482
USA
tel. 1(716)768-8151

Disclaimer: I have had no experience with G & G. Call them, not me.

>
><Old Pharte Mode On>

True, alas. But back in olden times, I was first introduced to the magic of radio via a crystal set. I was in elementary school, an era marked by by Sputnik, the hula-hoop and a little gadget called a 'rocket radio'. This was a little crystal set shaped like a v2 rocket. It worked! Of course, I immediately tore mine apart to see what was inside. That this little collection of strange objects could actually make sounds was utterly facinating. I built dozens of different crystal sets of dubious technical merit. Most of them worked!

A few years later, my family moved to within five miles of KVOO radio - a 50Kw 'clear channel' am broadcast station with a phased array of 3 *HUGE* verticals. I could no longer get anything else, but reception of KVOO was fantanstic! A simple crystal detector could even drive a small speaker. In fact, just about anything metalic in the house was a potential receiver.

I learned the code while throwing my paper route. A friend and I would ride our bikes and whistle back and forth. When we went for our Novice tickets, the test was given by a Ham that lived within a mile of the KVOO towers. When he turned his garbage disposal on, you could plainly hear (very distorted) music coming from beneath the sink :-)

2747. Numbers Stations

Newsgroup: rec.ham-radio
Date: 1990-05-10 14:23:46 UTC
From: charlie@oakhill.UUCP
Message-ID: <3285@radio.oakhill.UUCP>
Source record: 11803
Cross-posted to: rec.ham-radio,rec.radio.shortwave

I believe the numbers station is a great way to send messages
to remote areas without fear of looking suspicious on the
receiving end. Multiband radios are common drug store items
and don't look like spy equipment. Who wants to have crypto
spy equipment laying around your house if you are involved
in covert activities??? Remember in many 3rd world countries
a search warrant may be non-existent and the authorities bust
down your door and ramsack your place. If all you have is
a little radio you look a lot less suspicious.

As far as the code goes remember that a SUBSTITUTION CIPHER
is virtually un-crackable if you don't have the key. Like
the famous Beale Cipher the key can be a common document
like the Declaration of Independence. If the people sending
these messages are smart they will use a changing key such
as the first letter of each word of the front page article
in the local daily newspaper.

I believe that the numbers system is fairly secure as long
as you don't have a clue as to what the substitution cipher
key is derived from.

Hence all of this simplicity is fairly secure and doesn't require
a lot of expensive (and vulnerable to capture) crypto equipment.

That's my theory....
How'd I do... CIA???

I second John's opinions above. Particular brands to stay away from (in my opinion) are Yeasu (all of them) and probably some models of Kenwood. Also, the Icom IC-24AT might be one to avoid for a while until they start selling a better antenna (poor gain compared to other dual band flex types) and improving the display readability. Yeasu radios typically have poorly designed receivers and are subject to intermod and spurious reception.

I have purchased many Icom models and one Kenwood. Although Icom seems a bit stodgy (conservative) regarding features, they seem to make a very high quality and reliable product. The one Kenwood I bought (TH-21) has had nothing but problems.

The IC-2AT was a good model, but has no memories (thumbwheel switches set a single freq at a time). The IC-02AT was a good general purpose radio with all the features you are desiring. The IC-2GAT is also good if you want to run up to 7 watts of power. However, there is a tradeoff between power and battery life. I feel that 2-4 watts is a good range to stick with as you will still have adequate operating life, plus most repeaters will work fine with those power levels; especially in Colorado where most repeaters are 3 to 5 thousand feet above you! Icom also has very good service support. They have provided me with small parts for free and are always very helpful. Kenwood also seems to have good service support, but I recently had to order an electret microphone element for my TH-21. The mic element was about the size of an aspirin tablet and weighed maybe all of 1/100th of an ounce, but they insisted on charging $4.00 for "shipping and handling"! The part itself wasn't so bad (about 5.50).

As an aside, when I owned the IC-2AT, I was riding my motorcycle/sidecar rig down the highway at about 45 mph. It came unclipped from my belt, fell to the pavement, bounced up and hit the bottom of the sidecar, and again hit the pavement, then slid along the ground for a while. After all that, it still worked ok! Nice rig. I now have a IC-32AT and have come to really love it. At $550, it is not the cheapest radio, but it covers both 2m and 440MHz, has 20 memories, and can receive public service on VHF-Highband and UHF (with some simple mods).

Hello out there in Net-Land...

I picked up a Motorola MX-330S while I was in Dayton last month.
It's a 48 channel PROM programmable 2.5 watt HT.
Does anyone know of a source that other than Motorola that is
willing to sell and program a PROM unit at a reasonable price ??
I beleive Motorola wants something like 150 dollars for their services !

My second question is...

Does anyone know of any MT-1000 on UHF that can be configured to go
from 430-480 Mhz or wider ??? Is the relatively narrow bandwidth a limitation
of the software used to program it or of the radio itself ??

Anyone who has a similar interest in Motorola equipment can get in touch with
me via E-Mail.

I remember those days -- I did get the kit, and got it to work
with the help of a neighbor TV repairman. The way I believe we got it going
was to *NOT* sand the turns on the coil, and substitute an air variable
capacitor for tuning. We spent about a half hour trying to get the galena
chunk to rectify, and after much frustration, finally tuned in a station but
with mediocre results. My mentor then left, but shortly returned with a
germanium diode! What a radio! :-)

2755. 500 most common words in English

Newsgroup: rec.ham-radio
Date: 1990-05-10 18:20:50 UTC
From: kawai@csli.Stanford.EDU
Message-ID: <13554@csli.Stanford.EDU>
Source record: 11807

Dear all,

Being an aspiring linguist as well as an aspiring CW operator, I have come up with a list of words that occur frequently in English. The data comes from the so-called Brown Corpus. This is a large database of sentences from a wide variety of English text (with a notable bent towards journalism), and is considered to represent modern English prose fairly accurately. Appended below are the five hundred most common words. Since there isn't any amateur radio jargon in the list, the list is not so useful for practicing CW on software that will send you code from a text file. Does anybody have a list of Q-signals and common abbreviations? I can add them to the list, and make it more fun for CW random word practice. With, say, two hundred amateur radio words (including Q-signals and abbreviations), the list would grow to seven hundred words. If I could copy seven hundred words with the ease I copy "the", "fb", and "rst" (not to mention "CQ" and "73"), I would get much closer to ragchewing indeed. Any help and comments most welcome.

Source record: 11820

For those not familiar with NEC, it is a numerical code developed primarily for the analysis of antennas. I've been searching for it, but it doesn't seem to be available unless you need it, and then you have to prove it, and then you have to pay. It, of course, was developed and is distributed by our government. We certainly wouldn't want foreign nationals developing nuclear wire antennas!

Next - thanks to all those that responded to my request for information. I appreciate your efforts and hope this serves everyone well.

Anyway, there are products that are available both free and commercially that can fill the gaps. Here is what I know:

MININEC was develped in 1982 by A Julian, J Logan, and J Rockway at the Naval Ocean Systems Center (NOSC). It is described in Technical Document 516. It is a single program written in BASIC and is intended to be run on a PC. It is a scaled down NEC, but it is very adequate for Ham type antenna design and analysis. For "grounds", you get no ground, or a perfect ground. You can do the standard pattern runs, determine impedence, etc. Input must be in meters (a pain). I don't know where it is available, but you'd want MININEC3 anyway - which is available.

MININEC3 is a successor to MININEC. It was developed in 1986 by J Logan, and J Rockway at the NOSC. It is described in TD 938. It consists of several programs: MNPRE - a pre processor for NEC input files, MININEC3 - the workhorse, and MNPOST - a post processor for munging the various data computed by MININEC3. Some of the new bennies include: 1) input of NEC files (instead of by hand each time) via MNPRE, 2) computation of both near fields, 3) field patterns in DB or V/M, 4) more flexibility in saving different data to different files, 5) Specification of specific ground wires if desired (or use perfect), 6) it computes the wire endpoint connections for you, and 7) and a host of plotting options (none graphical - just data selection). This is written in BASIC. The .ARC file includes both DOS compiled executables in addition to the sources. GWBASIC won't run the sources for some reason. Sizing can be a problem for a complex antenna (about 50 segments or so is the limit without rebuilding them). These crunch numbers, so the faster the CPU, the better. If you have a BASIC compiler and a math co-processor, you're really set. MININEC3 is available from the simtel server on the internet. It's in the PC ham radio subdirectories. Suck it down, un-arc it, and you're off. You can figure out most of it w/o the document. Input, again, is in meters

Just mail the following line to "listserv@vm.ecs.rpi.edu"

/PDGET MAIL PD1:<MSDOS.HAMRADIO>MININEC3.ARC UUENCODE

There is a wealth of other neat stuff on simtel also - ham, pc, etc.

By the way, I tried to order the TD from NOSC. They told me that it wasn't available unless I was a Gov contractor and needed it. So, I went to the campus library and copied it. You'll need to go to the special government docuements librarian to find it. It isn't in the card catalogs.

NOSC
5285 Port Royal Rd.
Springfield, VA 22161
(703) 487-4650

MININEC3 is free and works well. You can complement it with some utilities that graph the patterns on you're screen. While it's fairly well written BASIC, it would be a chore to port to C (if somebody ports it, I want it)

YAGINEC. YAGINEC is under active development by Lew Gordon, K4VX. It was described in the March '89 QST under technical cooerespondence. I have version 7.01 and it is super. It contains several programs: GAMMA - for gamma matching computations, TAPER - for composite tubing element length equivalents, HAIRPIN - for hairpin matches, and YN - the Yagi optomizer program.
YAGINEC is written in QuickBasic and is shipped w/o sources. He does give some sample antenna input files. Some of the features are 1) non metric dimensions, 2) very slick data and menu input, 3) file input, 4) very slick and feature full plotting options (to screen or printer), 5) automatic frequency sweeps, and, 6) an optomizer - you can have it optomize a given design to your constraints (gain, f/b, etc). It is a very nice package. It is available for the super bargain price of $5.00 directly from the author. You'll get your disk in 2 weeks or less. My only beef with this program is that the YN program itself only works on YAGI antennas. (I play around alot with other antenna configurations.) Hopefully he'll add an arbitrary input menu to it. It is based upon MININEC1.

NOTE: I have a fortran version of MININEC which I'll describe later. Briefly, while fortnec (MININEC) and MININEC3 give me different answers for the same configurations, they're both close, and they both converge to the same numbers. Just slightly different algorithms. (MININEC3 does seem to converge faster, however). Note that you should read the documents to learn about the "problem" areas - such as needing more segments for anti-resonance situations, etc. This will help you get convergence faster and get more accurate answers if you don't bother with the convergence tests.

FORTNEC. FORTNEC was reviewd in the Feb 1990 issue of RF Design magazine. It is basically a fortran version of MININEC1. Good news for us workstation folk! The article was by Alan Carr. It has minor input and output format changes, but is basically MININEC1. You get

both compiled fortran (for a PC), and the fortran sources. It was
a minimal porting effort to port it to my DG AVIION workstation.
I use this extensively as it runs on my workstation which 1) is
a fast risc machine, and 2) has native fp support. A five minute run
on a 10 MHZ '286 takes about 30 seconds on my workstation. As the
interface is primitive (for PC stuff), I've written a bunch of pre and
post filters to support it. (Kind of like that Star Trek probe "Voyager"
that comes back as "Veger") Anyway, it is available for $9.00 from
RF Design Magazine. Order "Disk RFD-0290: February 1990" from:

RF Design Software Service
P.O. Box 3702
Littleton, Colorado,
80161-3702

MN3.0 This is the Brian Bezzley, K6STI, software. It was reviewed
in several recent issues of Ham Radio Magazine. It is, of course
feature laden with free form input, frequency sweeps, lots of
pulses, speed optomizations, automatically finds the take off angles,
computes the max gain, f/b radio, patterns, swr, etc....(I'm reading
this from his Ad in the May 1990 Ham Radio issue on page 74).
It got a good review. My biggest beef is that it costs $110. A MNjr
costs $55 (don't know content). I haven't been able to get my hands
on a copy locally to play with it. Also, 1) I'm cheap, 2) and it won't
run on my workstation anyway (yea-yea - get a PC; I know....)

YO3.0 is a similar product also by Brian. Lots of nifty features for
basic design and optomizations. Stuff for stacking, speed improvements,
etc. It includes support for designing gamma, T, hairpin, and beta
matches, taper computations, frequency scaling, and others. (again,
I'm reading the ad) It also was reviewed in a recent HR issue (they
were in subsequent issues). He wants $130 for this puppy, and, of
course, to bait you, has a Jr version for $65.

The reviews for MN3.0 and YO3.0 were good, but they are pricey - esp
for us hamfest hounds. Seems like Brian and Lew are duking it out for
price/performance features on YO3.0 vs YAGINEC.

Brian Beezley, K6STI
507-1/2 Taylor,
Vista, CA 92084

ELNEC. ELNEC is a product from Row Lewallen, W7EL. It is based upon
MININEC. I havent seen a review of this, nor have I tried it. I'm
reading this from the same issue of HR (May 1990) on page 78. It,
like MN3.0, has automatic pulse placement (VERY NICE), and has builtin
plotting, printing, etc. He touts "true current sources". Offhand, it
appears to be MININEC with auto source placement, current sources,
and some plotting features. It is available for $49.00.

Row Lewallen, W7EL
P.O. Box 6658

Beaverton, OR 97007

So! That is what I've learned from my research.

If you'd just like to tinker, I'd chose (not in order)

1) MININEC3. Flexible, and free

2) FORTNEC. Not quite as good, $9.00 and the sources
sources are probably usable on a non pc workstation.
You'd drop $9.00 on a 'coupla beers after work.

3) YAGINEC. Wonderful if you're into Yagi beams. great if
you just want the harpin and other utilities. $5.00
You'd drop $5.00 during lunch.

If you're into heavy modeling, I'd chose (not in order)

1) FORTNEC (just because you might have a mainframe or
a risc workstation lying around - *speed*) $9.00

2) MN3.0 and YO3.0 These seem to be very fully featured
and very nice. You pay for it also. $110 and $130.
You'd drop that on a Bencher paddle.....

3) YAGINEC It doesn't seem to have *quite* the features
of YO, but is sure looks close. $5.00 (Rumour has it
that Lew designed the "elephant gun" (10 element 10M beam
- 45 foot mast) with it.

In addition, most of the magazines bookstores sell MICROSMITH (sp?)
which has graphical and computer solution of smith chart type
problems. $49 (I think). I haven't looked at this yet.

These opinions are my own, and I hope I haven't miss represented
any products. Let me hear from you - with reviews of the ones I haven't
played with, or ,especially if you port MININEC3 to "C".

regards,
Mike Harris - KM4UL harrism@dg-rtp.dg.com

Is there no where that one can purchase an R1 in the U.S.?

Are the US and Japanesse models the same?

If so will anyone in Japan buy me one?

2762. Any Bay area Hamfests - June & July??

Newsgroup: rec.ham-radio
Date: 1990-05-10 22:39:38 UTC
From: rockwood@kean.ucs.mun.ca
Message-ID: <86128@kean.ucs.mun.ca>
Source record: 11802

With a trip planned for the Sacramento, San Francisco area for the last week of June and the first two in July, does anyone know of any Hamfests underway in the area around those times? Specific dates aren't established, so I'm being somewhat vague. We're also planning a week in Los Angeles, but that is booked - start to finish.
Would appreciate info.

2763. AMSAT bulletins via FTP?

Newsgroup: rec.ham-radio
Date: 1990-05-10 23:42:43 UTC
From: elmquist@nachos.SSESCO.com
Message-ID: <191@nachos.SSESCO.com>
Source record: 11815

I posted this awhile ago and got no response....perhaps it didn't go out.

Does anyone keep the latest AMSAT bulletins on-line anywhere for anonymous FTP?

Someone was posting them to this newsgroup for awhile (KA9Q ??) but that action seems to have stopped.

The AMSAT BBS is nice...but continuously busy. I can perhaps offer to be the FTP site if someone will e-mail me current bulletins (including the AO-13 mode schedule please...)

Thanks. 73, N0JCF

(and Pat Barkey @ indiana.edu... I'll be e-mailing you shortly. Our packet connection is gone again...)

This is true so long as the receiving party doesn't need the
information within a week of receipt :-). This mode doesn't
break any speed records.

My theory is that the numbers stations ARE in fact the key
to some cipher that is transmitted via a different medium...

Ken--

What kind of problems have you had? I've had a TH21AT for 3-4 years,
and it's never hiccupped once. I've also had an ICOM 2AT for about 8
years and a Kenwood 7600 mobile rig for 10 years; both have been
very reliable.

Is there any real evidence that there even will *be* any ATV (FS or SS)
on STS-35?

I know there was a mention of it in a NASA press release, but I haven't
seen any mention in the materials from the ARRL, and I trust them more
than I do NASA on this one.

2768. UHF TV band in Europe.

Newsgroup: rec.ham-radio
Date: 1990-05-11 08:20:27 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <11.May.90.09
Source record: 11804

UHF TV: well over this side of the Pond we have almost all our terrestrial
TV on UHF (Channels 21 through 68). Different countries use different
modulation methods and audio/video splits. We have PAL (most of Europe)
and SECAM (France) with 5.5, 6 or 6.6MHz audio/video splits.
Some also use inverse video modulation. Vive la Difference!
We *used* to have VHF TV (on 41 to 68MHz, 'Band 1' and 174 to 216MHz
'Band 3') 405 lines monochrome, but these stations are almost all gone now
(completely gone here in the UK some years ago).
The band 41-68MHz has over the last few years been reallocated to
land mobile (hams getting 50MHz) and likewise 174-216MHz has gone to a
trunked, digitally-controlled mobile service.
The band 66-88MHz was never used for TV in Europe (West europe has mobile radio
in there, some Eastern countries have FM broadcast radio in here too).
The European frequency allocations arent always understood by equipment makers;
for example the number of scanners imported with the 30-50MHz range enabled is
quite great - all you could hear until recently was TV video buzz! Should have
had 66-88MHz enabled for Europe, but seems 'nobody told the importers'! HI

2769. Loop antennas - a UK Perspective.

Newsgroup: rec.ham-radio
Date: 1990-05-11 11:14:09 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <11.May.90.12
Source record: 11811

Someone was asking about loop antennas (relating to new AEA product). Well i thought i would draw your attention to a British series of products; made by a company called CAP*CO. There are several versions on the theme; all are loops with tuning capacitors (loop mounted so its diameter is in the vertical plane). They do remote-tune versions so you can stick the beastie up a tower. Theres also receive-only versions. The transmit versions use thick tube (about 1.5 to 2 inch diameter), to keep losses down. I have had no personal experience of these loops, if anyone is interested I will post details and address (when i can find them). CAP*CO also do nice antenna tuners (lovely big silverplated roller-coaster coils and *W*I*D*E* spaced tuning capacitors; real beefy jobs). Price (and weight!) is as would be expected for such a style of manufacture (we are talking quite a few hundred pounds sterling) but having seen inside one, nothing short of hitting with a sledgehammer would damage it. If it was not for the TVI problems, i guess they could make a transparent-cased version and sell the thing as art. It really is beautifully engineered and constructed!

Pete Lucas G6WBJ PJML@UK.AC.NERC-WALLINGFORD.IBMA 0793-411613

2770. Ceramic things

Newsgroup: rec.ham-radio
Date: 1990-05-11 11:41:01 UTC

Message-ID: <9005121026.AA28511@ucbvax.Berkeley.EDU>
Source record: 11814

Ok, guys -

I wasn't deliberately trying to be elusive. Those 3/8"
ceramic do-dads are from a ball mill. Several of them are
placed in a steel cylinder and rolled/tumbled for a few hours
to pulverize rocks or other brittle material. The dust
that is left is used for X-ray analysis. I have no idea
who the original poster was, or why he wanted the information.
He said somthing about a crime, so perhaps some of these things
were used as slingshot ammo - I dunno.

2771. Need QSL route for JT1CS

2772. Crystal grinding - use rouge.

Newsgroup: rec.ham-radio
Date: 1990-05-11 14:18:46 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <11.May.90.15
Source record: 11752

If you want to try grinding a crystal, i suggest you try Jewellers Rouge as the abrasive. This is much finer than household scouring powder (AJAX) and although it takes a lot longer to grind, you are less likely to lose the crystal activity (activity loss is, in part, due to the unevenness of the ground surface as a result of the harsh abrasives).
Rouge is used for polishing some types of lens; you can get an optically good surface if you are careful.

And i thought 'kitchen table engineering' was a thing of the past...!

Sorry - I forgot to include ELNEC in my summary. Anyway, I don't know whether to put it in tinker or modeling as I don't have enough info on it. I'd reccomend getting more info from the authors before you drop the $$ on the pricey packages just to be sure you know what you're getting and what you're not getting. Remember, your mileage may vary.

>
>Anyone else heard anything?
>
Here is what I heard from a friend who travels regularly to Japan
and has contacts with Icom in Japan.

The radio, as currently designed, is capable of receiving the
cellular phone band. Since it is illegal to intercept cellular
phone, Icom is having difficulty getting FCC type acceptance and
importing the radios. Therefore, Icom has decided to pull the
current radio, and come out with a slightly modified version
which does not receive cellular phone. I think you will see
this radio back on the market in modified form very shortly.
I also suspect that enterprising hams will find a way to
"remodify" the radio back to its original form.

By the way, my friend picked one up last month in Tokyo and he
really loves it. Don't worry. Icom has no problems with the
radio or its production. You will be able to buy one real soon
now.

I would have trouble with this: given the regularity of the traffic,
I think you'd be able to intercept enough to break a simple substitution.
>
> >Hence all of this simplicity is fairly secure and doesn't require
> >a lot of expensive (and vulnerable to capture) crypto equipment.

This would tend toward the 'low-grade' or easy to break cipher point
of view.

>

Well I doubt this. If you put the key out there in plaintext for all
to catch, then you have really compromised the cipher, and all the
opponent needs to do is intercept the traffic.

Later,
Andrew Mullhaupt

Unlike the other HP responses, I have had great success with Kenwood HT products. I've had a TR2600A for 3+ years that I've just retired to be my packet radio transceiver. To upgrade, I purchased a new Kenwood TH-26AT last month, which I like alot.

The problem with trying to find a reasonably priced used HT with all the feature sets you are after is that they are all getting grabbed up quickly by folks looking for portable packet radios. Unless you've got a good swap source, you'll be trying to buy in a seller's market and the $'s you spend won't be reasonable.

My advice, would be to buy new. 1) you get all the features you want now, 2) you get the manufacturer's warranty, and 3) you can incrementally add on options within the lifetime of the product. This last point is important in that the radio model probably won't go obsolete too quickly.

I used to have the call WA6SIE. Very nice for CW (at least the suffix).
Unfortunately, the entire time I had the call I lived in apartments with
no HF gear or antennae, so I never used it on CW.

On 15m CW last night, I worked a bizzare one:

8J90XPO

Conditions were fading, so it was a quick QSO. According to my list,
this prefix belongs to Japan. Sounds like a special events station.
Anyone know anything about it?

Mike Edelman (KE8YY) inquires:

>I was looking at an ad for the new AEA antenna ad in AES's ...
>another variant on the small capacitively tuned loop idea ...
>Has anyone played with this thing yet, or perhaps with other variants
>on the same idea..?

To shorten an antenna, you have to load it. However, most of the RF gets eaten up by the coils. So you start taking off as many turns on the coil as you can. But you have to offset the L component with a C component. So you have a big capacitor at the end. Which gives you very narrow bandwidth. I have not used the AEA loop (looks like a football stadium portable seat to me), but a friend calculated that the bandwidth should be in the range of 10 to 20 kHz with around 80% efficiency - that is, you sacrifice bandwidth for the sake of RF.

The use of emotive words like "eavesdroppers" to try to sway arguments is called innuendo, the neutral word would be "listeners". Listening to cellular telephone conversations may be _illegal_ in the US, but radio waves have a history of not respecting national boundaries. The question of whether it is morally wrong to take radio transmissions that are not intended for your reception is, in my opinion, moot. However cellular transmissions are a special case only inasmuch as there are large and powerful vested interests. A problem with all telephone systems is that the users have been systematically lied to about how much privacy they have.

Unless of course experimenters acquire commercial equipment and modify it. Radio experimenters have something of tradition of doing just this.

If cellular radio really will be secure against unathorized reception, then surely there should be no law against such reception, after all we don't have laws against teleportation or telepathy do we?

Henry Black (G4NOC, KK6JR) henryb@hpspd.HP.COM +1 415 857 6655
These are my views, not necessarily my employer's views.

P.S. I'm in favour of radiotelephony including cellular, but also in favour of truth and openness.

Here are the answers to the question I posed a few days ago. Kevin mailed
the answers so, I'll just use his posting and add a litle more explaination.

>From: "Kevin B. Kenny [the Arch-Traitor] KE9TV" <kenny@cs.uiuc.edu>
>
>>Anybody out there know what the community now calls these measures?
>>cps, kmc, mickey-mikes.
>
>Hertz, `gigs' (GHz), and `puffs' (pF), respectively.

cps is cycles per second, which we now know as Hertz.
kmc is kilo-mega-cycles, which we now know as giga-Hertz.
mickey-mikes is for micro-micro-farads, micro-micro is now referred to as
pico or puffs and is usually used when referring to capacitor Farad values.

regards, Dave

>most basic information about HF?

Since WWV doesn't transmit near any of the old ham bands (80,40,20,15,10),
no ham reciever I have ever owned can pick up WWV. I think this is
pretty typical of pre PLL receivers. In light of that trend, how can you
say that WWV information is most basic?

Regarding the exam process, I think the idea of a small fixed question pool
is more of a problem than whether WWV is covered in the pool.

Well, the Yaesu FT101 (pre-PLL) had a special bandswitch position for
WWV/JYY, and I believe some/most Collins could get to WWV...

2785. DOVE! Info please?

Newsgroup: rec.ham-radio
Date: 1990-05-11 18:52:24 UTC
From: wille@hpccc.HP.COM
Message-ID: <5540034@hpccc.HP.COM>
Source record: 11733

I have some questions regarding DOVE-Oscar-17.

1. Has the beacon on 145.825 been turned back on yet? If not, when?
I think I hear a weak signal at times that correspond approximately
to DOVE's period, but not to my orbit predictions (see #3).

2. When DOVE-1 starts transmitting voice, will it be on 145.825 FM,
or on some other frequency?

3. How long are orbital elements good for and where can I get updates
when the ones I have get old? I know they are occasionally posted
to the net. The ones I have don't work, or it might be that the
beacon is just turned off.

4. How do I capture the DOVE telemetry data? (I realize that this
was discussed a while back, but I didn't have my PK-232 then! :-)

Thank you for your help,

Charlie (KX7L) asks:

> On 15m CW last night, I worked a bizzare one:
> 8J90XPO
>Anyone know anything about it?

Intimately. You got the call right; there's a big controversy among JA hams about the "90" in the callsign. Packet people don't like the numbers of characters. Purists argue that there is no call district 90 and insist on the /JA3 suffix.

8J90XPO, or, according to nit-pickers, 8J90XPO/JA3, is the "Osaka Hana no Banpaku Kinenkyoku" ("Osaka Flower Festival Special Events Station"). As all other special events stations, it is sponsored by JARL, and is open for use by JARL members (a rule I hate). The Flower Festival itself has been a fair success; you have gardens both indoors and outdoors, with hothouses for tropical plants and air-conditioned rooms for Arctic flora. The Japanese have always been passionate about flowers, and this time, people are queueing for several hours just to see flowers! And they pay for it, too.

8J calls are being assigned, by convention, to special events stations. Other 8J calls include 8J1XPO, 8J1YES, and so on.

Incidentally, 7J calls (which also belong to Japan - Japan has JA thru JS, 7J thru 7N, and 8J thru 8N) are assigned to recriprocal calls. Unfortunately, recriprocal licenses are terribly expensive in Japan (9,000 yen, or roughly 60 dollars). I hate this, and have argued against it, but have been ignored so far. (I'm Japanese, so I can't get a recripocal anyway, but I don't think it's polite to have your guests pay for a hobby that you share.)

I would also like to see an FTP site for Amateur related news items.
Especially for the electronic versions of the ARRL Newsletter, GateWay,
QEX Experimenters Exchange, and maybe even the W5YI Electronic Version
from Compu$erve(??).

I know of an FTP site named 'hamster', but I don't know if they have the
latest bulletins. Also, 'k9iu.bacs.indiana.edu' seems to have SOME of the
ARRL Newsletters and Gateways, but not always the most recent ones.

(The reason I'm interested is for extracting useful articles for our club
newsletter, so I don't have to key them in manually. :-) If someone gets
them regularly and we be so kind as to mail them to me, I'd also be very
interested.)

I don't understand how the Icom R9000, Icom R7000, and Yaesu FRG9600
are type accepted if this is true.

Gee, and all I had was a $20 SWR meter to trim the J, and an hour to
kill probing for the 50 ohm point.

Contrary to popular belief, HP engineers don't use a $50,000 instrument
to build a $5 circuit.... Unless it just happens to be on the shelf. :-)

I started getting interested in ham radio with an old Hallicrafters SX-111
receiver. It had WWV builtin with a 100 khz calibrator that I could use
as well.

Cross-posted to: rec.radio.shortwave,rec.ham-radio

I am considering a Sony 2010, but have a couple of questions that are unanswered by the reviews I have read here and in Passport.

1) What are the dimensions? I can just guess that the thickness is slightly larger than a D cell diameter.

2) With SSB and CW, there is no carrier for the synchronous detector to lock on to.. Does it just act like a normal BFO for these signals?

3) Would it be suitable as a ham reciever for field use or at home, maybe with a homebrew qrp tranmitter. I guess I would just turn it off during transmit if there is no "standby" mode.

Thanks,

Don Perley

> "remodify" the radio back to its original form.

If the FCC is refusing type-acceptance just because it is capable
of receiving frequencies that happen to also be used for cellular
services, then we need to know about this, and immediately. There
is no authority I know of for the FCC to refuse the type acceptance
on such grounds since the ECPA does not outlaw the ownership, sale,
or import of such devices. There *IS* legitimate use for hams to
receive signals on such frequencies without receiving cellular.
If you don't know what I mean, get out your interference handbook
and reread it.

If Icom is having this problem, then we need to find out from them
just who at the FCC is their contact, or who it is that has ordered
the type-acceptance refusal, and do something about it. But we need
to get this info (or the truth, whatever it really is) from Icom.
I plan to call Icom as soon as I find the phone numbers again and
talk to them about it. I certainly won't accept the silly "production
delays" answers since my question will be one for their lawyers instead
of their marketers. Perhaps I should ask for their legal office right
at the first answer.

> By the way, my friend picked one up last month in Tokyo and he
> really loves it. Don't worry. Icom has no problems with the
> radio or its production. You will be able to buy one real soon
> now.

Well, since we know this, we certainly know the "production delay"
problem is more than just a delay. It certainly is one of these
various possible cases. I just hate to see us get shafted with
a lesser useful radio because of Icom-America buckling under some
sort of uncalled for pressure from the FCC or the cellular industry.

WE NEED TO GENERATE SOME COUNTER PRESSURE!

>
> PS anybody have some more info on these low power TV stations ?
>

I have some more info on these low-power UHF TV stations. Licenses are
being applied for and granted, rapidly, as the new FCC rules take
effect. Here in Rochester, we now have two such transmitters- W15AL on
channel 15, and as mentioned, W38AW on channel 38. More are in the plans
for this area within the year. They are basically allowed to run any
type of programming they choose, except they cannot run any of the major
network stuff, and they are not to be picked up by local cable operators.
W15AL transmits music videos 24 hours a day, and you can call a 900
number to request a video- they put a menu up periodically with the codes
for the selections. They charge $2.50 a call, and that's how the station
is supported. They are apparently tied in to something called "The
Jukebox Network", a loosely formed group of these broadcasters based in
Miami (I think). They are limited to 1 kW and the expected range is 8-10
miles, but W38AW seems to do better than W15AL- I get a MUCH better picture
from their test pattern than I do W15AL's video, both transmitters are
(to the best of my knowledge) located on Pinnacle Hill with all the other
TV transmitters in Rochester.

These stations are one of the reasons the FCC mandated that cable operators
supply customers with an A-B switch so the customer could get live stuff
off the antenna if he wanted it.

I hadn't heard that they were only supposed to operate on a non-interference
basis. Seems like that would be a problem, since these stations are
money-making entities and as such, are not likely to "turn the transmitter

off" because of an interference problem. I think the power limit is the factor which will limit interference, since the range is so short.

BTW,last time I checked, W38AW was still only putting out a test pattern. I understand they should go live any time with old reruns or something.

Message-ID: <4289@tekfdi.FDI.TEK.COM>
Source record: 11750

Someone wrote asking about an old crystal grinding article. (I missed
the original article while at MTT-S).

There is indeed a computerized way of finding old Ham related articles.
It is a program supplied by: didah publishing
P.O. Box 7368
Nashua, NH. 03060

I just ran the copy I bought at Dayton, and got a list of some 390 or so
articles related to "crystal". The ones following looked like they
might relate to the original question of grinding or shaving freq:

QST jul '52 p68
QST jun '49 p120
CQ oct '49 p36
QST apr '30 p41
73 jul '68 p50
CQ jul '45 p16
QST aug '56 p65
QST apr '53 p51
QST jul '53 p48
QST mar '53 p138

I used my own guess from the listed titles to choose these, so for better
completeness , run your own copy of the program. (runs on a PC.)

While I agree with Phil's concerns, I suspect that they are misplaced.

I think the R-1 hangup is patent related. Uniden, having acquired ALL
domestic makers of scanners, now owns a lot of scanner patents, and
apparently is starting to enforce them against other scanner makers.
For example, selective scan delay and front end track tuning are
patents held by Uniden. i.e. - if you want to buy a good scanner,
it will have to be either made by or licensed by Uniden. I don't
know what other patents they may hold.

I personally think this is a crock - both of those techniques are
obvious, and one requirement to uphold a patent is that it be
non-obvious! However, I don't know of any scanner manufacturers
fighting the patent. Hmm.... I built a working scanner in 1965,
which was more than 17 years ago and thus clearly predates
any scanner patents still in force... should have patented
it (however, it didn't have either selective scan delay or track
tuning)!

]WE NEED TO GENERATE SOME COUNTER PRESSURE!
]

Only if we find the FCC is really at fault, and this this is not
just an urban rumor.

2801. Packet/Internet gateways

Newsgroup: rec.ham-radio
Date: 1990-05-12 15:30:17 UTC
From: thomas@mvac23.UUCP
Message-ID: <223.UUL1.3#5131@mvac23.UUCP>
Source record: 11756

I've often seen messages on this net which have been reproduced from packet sources. I'm wondering if there is either 1. a gateway packet machine which allows someone like me to send e-mail to a packet site or 2. someone on the east coast of the USA who is interested in performing that function.

Reason: my uncle in the Shanandoah valley of Virginia is getting into packet radio and will soon be on packet e-mail. However, I don't have enough time to add packet radio as Yet Another Hobby to my list (sorry guys). But I'd still like to be able to communicate with him electronically since it is e-mail in both places and internet networking is on my Officially Recognized Hobbies list.

Thanks for any help,

- tom

SpaceNews
=========

MONDAY MAY 14, 1990

SpaceNews is published and distributed weekly around the world on USENET
and Amateur Packet Radio. It is available for unlimited distribution.

* STS-35 NEWS *
===============
The launch of STS-35 has been delayed at least until 31-May-90 due to a
Shuttle hardware problem.

Here is the expected operating schedule for unattended SAREX operations by
Ron Parise (WA4SIR):

Mission Elapsed Time
(D/HH:MM)

Start End
========+========
0/22:00 - 1/10:20
1/21:15 - 2/08:35
2/20:00 - 3/07:55
3/19:00 - 4/06:40
4/18:30 - 5/05:45
5/17:20 - 6/05:50
6/17:40 - 7/05:35
7/17:45 - 8/04:45

Listed below are the frequencies presently intended to be used by SAREX for
both packet and voice. Note, that in no case is "simplex" operation
indicated. DO NOT CALL WA4SIR ON THE SAME FREQUENCY YOU HEAR HIM!!

Shuttle Accompanying Offset
Transmit Freq. Shuttle Receive Freqs. Designation

Group 1 145.55 MHz 144.95 MHz Primary
145.55 MHz 144.91 MHz Secondary No. 1
145.55 MHz 144.97 MHz Secondary No. 2

Group 2 145.51 MHz 144.91 MHz Primary
145.51 MHz 144.93 MHz Secondary No. 1
145.51 MHz 144.99 MHz Secondary No. 2

Group 3 145.59 MHz 144.99 MHz Primary
145.59 MHz 144.95 MHz Secondary No. 1

Group 4 145.55 MHz 144.95 MHz Primary
145.55 MHz 144.70 MHz Secondary No. 1
145.55 MHz 144.75 MHz Secondary No. 2
145.55 MHz 144.80 MHz Secondary No. 3
145.55 MHz 144.85 MHz Secondary No. 4

The 145.55/144.95 combination is in both Groups 1 and 4 because alternate uplink frequencies from Group 1 would be used over North and South America while those from Group 4 would generally be used in other parts of the world, such as Europe and Africa.

Dissemination of Shuttle information to those participating in SAREX, as well as all interested amateurs will be via a system of key stations, particularly WA3NAN, at Goddard in Greenbelt, MD, W5RRR, at the Johnson Space Center in Houston, and W6VIO at the Jet Propulsion Lab, in Pasadena, California. These stations, and others, will operate on HF and VHF 24 hours a day carrying official NASA supplied voice communication between Mission Control in Houston and the Shuttle crew. To further provide information specific to SAREX communication opportunities and related information, bulletins originated by amateurs stationed at the Johnson Space Center will be fed via a computer network to these stations and others including W1AW. The SAREX Metabeacon may also be used for announcements. It is planned the frequencies listed below will be used for this service. The selection of frequencies will be made depending on HF propagation conditions during the mission.

Station Approx. Nominal Frequencies in MHz
QTH (+/- QRM)

WA3NAN Wash. DC 3.860, 7.185, 14.295, 21.395, 28.650. 147.45 (FM)
W5RRR Houston 3.850, 7.227, 14.280, 21.350, 28.495, 146.64 (FM)
W6VIO L.A. 3.840, 21.280, 224.04 (FM)
W6FXN L.A. 145.46 (FM)

All are SSB using the sideband normally used on the band unless otherwise noted.

What about the Icom R-7000? As far as I know, this receiver easily receives
all of the cellular band, and you can buy it at any participating
amateur radio store (25MHz to 2GHz coverage). Maybe the R-7000 received
type acceptance before the ECPA passed Congress? Do you need FCC type
acceptance on receiving devices before you may sell them in the United States?

The patent conflict seems more likely.

2804. How frequencies are assigned ??

Newsgroup: rec.ham-radio
Date: 1990-05-12 18:58:40 UTC
From: nrg@nsscb.UUCP
Message-ID: <1578@nsscb.UUCP>
Source record: 11758
Cross-posted to: rec.ham-radio,rec.ham.radio

First of all, I would like to know how frequencies are assisgned to various radio stations. Because on most of the frequencies, lot of stations will be relaying at the same time causing lot of distortion/interference. With this which ever station is stronger or closer will take over leaving no scope for weaker stations. If there is any governing body they should not assign same freq. to more than one station who start at the same time.

Secondly, one station is relaying on 15120 and 9610 khz at a particular time.(that country's home services). How difficult is it if they want to extend the same transmission to 11620 khz besides 15120 and 9610 at the same time. (Assuming they have more than one transmitter).

Radio devices do need part 15 certification to be sold or imported into
the United States.

This certification says NOTHING about what the radio's capabilities or
authorized uses are; it is strictly dealing with the radio's (in)ability
to interfere with other radios.

There is no authority in the ECPA that prevents the sale of devices
capable of receiving the frequencies the cellular service uses. If
the FCC is denying part 15 certification because a receiver is able
to receive the cellular frequencies (825-845 and 870-890) then it is
my opinion the FCC is acting illegally.

There is another possible cause for retrograding the radio to delete
those frequencies. The cellular industry might have threatened Icom
with a law suit, which we know will costs lots of money even though
Icom would win. The extremely sad state of legal affairs in this
country makes it possible to manipulate business this way. I don't
know that this has happened, but if it has, then I would like to see
the hams form an organization that can do its own form of legal
threatening.

Of course there still exists the possibility that a patent conflict
exists for a patent whose owner failed to obtain protection overseas.
An owner who makes demands at such a level as to force someone to go
back and redesign their invention out of the device has done poorly
in making sure of his own profits.

The rumors on this will go on for a while. When the radio does ship
in the US, its features or lack thereof will tell some of the story.
If the cellular frequencies are removed, then I personally would urge
that the radio be boycotted as a form of counter pressure to the
manufacturers to convince them that buckling under to pressure from
other sources is not to be taken trivially. There is no valid reason
to delete any frequency range in the receiver.

> the users have been systematically lied to about how much privacy they
> have.

I believe we really SHOULD do something about this. One simple way is to simply spread the word around to everyone you know that cellular telephone conversations have a somewhat better expectation of privacy than cordless phones, but definitely not infinitely so.

Why cellular communications have some increased expectation of privacy:

1. There are 666 channels to scan through instead of 10.
2. There are fewer radios that can scan 800 Mhz, and they are a bit more expensive on average, but they exist and are in common use.
3. It is illegal to listen to cellular transmissions, no matter what frequency they are found on, but we know how much respect most people have for laws that prohibit what people do in their homes that cause no harm to anyone.
4. The voice channel on cellular uses exactly the same method of modulation as conventional two-way radios.

Why cellular communications are not completely secure:

1. Older TV sets with channels 70-83 still in them can receive cellular transmissions on channels 73-75 and 80-83. This fact should be taken with extreme concern by persons who are easily offended by strong language, especially if they have children.
2. Legitimate non-cellular uses exist for receivers that are capable of receiving the same frequencies as the cellular service uses.
3. Methods of making receivers that have cellular frequencies removed capable of receiving on cellular frequencies exist and are well known. Most units can be modified by adding or clipping some control diodes. Those that cannot, and for those not wanting to go inside, block converters exist that convert the 800 Mhz frequency block down to more conventional scanner frequencies.

I don't necessarily have all the reasons posted. If you come up with some others, you might want to post them.

My general advice to anyone considering the purchase of a cellular phone is to consider the communications on the phone to be open and public to people who for the most part you do not know. Unlike amateur radio, you can conduct business on the phone. Most hams don't worry about the privacy of their ham communications, and were business to be legal they would probably be ordering tons of pizza regularly. However with cellular, those who listen might try doing things nasty just because they think you have an expectation of privacy, like calling up the pizza place, citing the same phone number you just gave them, and changing your order. To prevent this, upon the initial order, tell the pizza place that ANY changes must be verified by calling you back since you are calling from a cellular phone.

Be sure you understand me; I am not saying cellular phones are bad; I am just trying to get the perspective straight. I am even considering buying a cellular telephone myself. One definite advantage of one of those portable cellular phones, if you get an AC power supply or a spare set of chargeable battery packs, is to avoid having to use that dreaded "call waiting" when you are using your home computer calling out on a modem. Just forward your phone to the cellular, or tell your cellular number to your friends, and go ahead and use the main phone line on the computer.

> If cellular radio really will be secure against unathorized reception,
> then surely there should be no law against such reception, after all
> we don't have laws against teleportation or telepathy do we?

Well, so far I have never met anyone who can teleport.

I don't get it......Icom already sells radios that make no attempt to restrict cellular coverage. No mods required. What is special about this one that would attract the FCC's interest? I thought the ECPA only prohibited selling devices that are SPECIFICALLY designed to intercept cellular phone calls.

Any ideas on this? Or did Icom's other radios come out before the ECPA, and then get grandfathered?

I always thought that the reason that Tandy restricted cellular coverage on their scanners was because of marketing considerations due to the fact that they also market cellular phones, not because of legal problems.

Can someone enlighten us on this?

>
> >goh<

The AEA antenna gets around the bandwidth problem by having a motor
driven capacitor. At any one setting, the bandwidth may be narrow,
but to change frequency you just nudge the remote cap control for
minimum reflected power.

From the RISKS digest:

Date: 5 May 90 02:34:32 GMT
>From: chuq@Apple.COM (The Bounty Hunter)
Subject: So many weapons, so little radio spectrum

>From the May, 1990 issue of Monitoring Times, Page 4:

Electronic Blizzard Brings Down U.S. Planes

The Scene is Libya, 1986. High in the sky, an armada of 33 high-tech U.S. fighter planes begin their attack. But something is wrong. One plane, carrying two crew members, crashes. Of the surviving 32 planes -- including five F-11's -- seven are unable to get off even a single shot. The probably reason: an electronic blizard that, according to Pentagon officials, came not from the Libyans but from high-powered U.S. military transmitters that filled the night sky with electronic signals designed to jam Libya's anti-aircraft defenses, hunt down targets, guide weapons and communicate.

According to Air Force Colonel Charles Quisenberry, during the Libran strike, U.S. weapons "were interfering with each other." Numerous U.S. weapons, some of which were electronically guided, went astray during the attack, damaging three foreign embassies and diplomatic residences, uncluding those of France and Japan.

Further, says Quisenberry, some of this interference can "actually effect the ... aircraft's flight controls as well as its fuel controls," either putting a plan into an uncontrolled turn or dive or turning off its fuel supply.

The Pentagon recently finished a classified seven-month investigation of the prolem which led officials to order a more detailed three-year probe. Preliminary studies of one war plan shows "thousands of [frequency] conflics" among weapons. Says Quisenberry, "There are major, major problems out there..."

2810. Ok, How do I get started?

Scanning radios are not type-accepted. They are certified (See Title 47 part 15, and part 2 subpart J). This is the same procedure that personal computers go through. (The list include Verification, Notification, Certification, Type Acceptance and Type Approval, and, boy, am I glad I'm not a lawyer and have to read this sort of stuff all the time.)

Sounds like the R-1 puts out too much spurious stuff.

While it is not really a hamfest, on the second Saturday of each month, a rather large and *very* popular ham flea market is held at the Foothill Junior College in Los Altos Hills, CA. This is about 35 miles south of San Francisco. You get to it by taking Route 280 South from San Francisco to the El Monte Road exit. Talk in is on 145.27- which is a repeater local to the south bay/Mountain View area.

RTTY DX Notes, 1of3, 5/11/90

RTTY DX Notes for Weekending 11th May 1990.
Part 1 of 3.
BID: $RTDX1105

It seems to me that some DXpeditions go out well prepared, with good
gear and good operators, while others do not. But speaking of
dxpeditions, DX1 has heard of one that will be going to Lord Howe
Island, signing VK9LI, for the A.N.A.R.T.S. Contest June 9th to 11th.
The operation will be for three days prior to the contest and two or
three days after the contest. This will be an RTTY only operation,
and will not be running linears. As DX1 appears to know about it, you
might as well send your QSL etc to him.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1ACB, JA1BLV, OD5NG,
TG9VT, VK2EG, W1DA, W2JGR and the Tri-State DX Association VHF packet
cluster. Your information is really appreciated.

RTTY DX Notes, 3of3, 5/11/90

RTTY DX Notes for Weekending 11th May 1990.
Part 3 of 3.
BID: $RTDX1305

QSL Information.

BY4AA will QSL via Box 085-205, Shanghai, Republic Of China.

T32AB says to send his cards to N7YL.

XW8KPL for some reason says to QSL to Box 310, Vientiane, Laos. (His home call is JA3MNP).

EO5O will receive his cards via Box 7 Chadyp-Lunga 27870, USSR.

EN8TJ will QSL via UT5JCF.

UC1TWR will QSL via Box 57, Grodno, 230003 Bylorussia, USSR.

Notes of Interest.

XW8KPL is active on 20 and 15 meters for a period of 1 to 2 weeks. After that stint they hope to operate from XZ (Burma) and S2 (Bangaladesh) with RTTY in both places. Though from reports from a reliable source, it is considered that RTTY would be impossible from both places. But we will wait and see what happens.

Conway Reef should appear from 17th to 29th May with six operators, though there is some doubt about RTTY.

Kuria Muria, A43KM/0 is expected about 17th to 24th May, again there is some doubt about RTTY.

Spratly has gone QRT, despite rumours to the contrary.

YV0AA cards should be available mid June.

Jan Mayen, JX9CAA reports that there are four operators there at the moment. JX2FL will operate SSB and CW from April until July, JX7XL and JX7DF will be there from April until October and will QSL via (call) N8013, Jan Mayen , Norway. While JX9CAA will be there from April until October and will be the only RTTY station operating and will QSL via LA5NM, he will be on RTTY on 14085 KHz and packet (at LA9FV) on 14109 KHz.

R3AVE, EO5O and the other odd Russian calls are special calls for the celebration of the end of WW2 with Germany.

Finally, don't forget the A.N.A.R.T.S. RTTY Contest June 9th 0000Z until June 11th 0000Z. See you there, and look for VK9LI. A report received says that JT0DX cards are being received in JA land. More hope.

GL DE DX1 (VK2SG).

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.

But Icom IC-28 line is worse than Yaesu 211 line in intermod and and selectiv-
ity. (I'm just talking about mobile units).
Icom 02AT line is good and rug.
Except for Yaesu bad reputation in costomer services, I don't see their design
being inferior nor their durability. Why stay away?
I had a Kenwood 21AT for some years and it has no problem, but I understand
it's layout is not very neat inside.
The current Kenwood HTs is lacking features (and size) to Icom and Yaesu.
But my Kenwood TH-215 has very sensitive and selective receiver, best I've
seen yet.
All three brands are as good to me. Standard (Heath Kit) follows very close.
I noticed most people prefered Icom. why?
Kenwood wins out in looks too.
Icom wins in accessories compatibilities, and size in new ones.
Yaesu is still good in features (back lit keyboard in 470), and design.
My lost FT-23 was the best features/size at that time!

I want a 470 or 24AT later.

I am very much interested in having the VOA Broadcast Schedule posted to the net. At the very least (if there in no sufficient interest) have it available via some ftp site such as uunet.

About the frequency of posting it, if and when the schedule changes. You can post the diffs, or post everything again. This depends on how often the schedule changes and how much is changed. If the VOA Magazine is published bimonthly, then lets have it bimonthly.

Someone once posted that they had schematics for a circuit that would descramble frequency-inverted audio. I would like to see these. If you know of such schematics and where I can get them, or perhaps you know the address the original poster gave to send an SASE, please let me know.

> Except for Yaesu bad reputation in costomer services, I don't see their design
> being inferior nor their durability. Why stay away?

They have a thin plastic feel to me. Also I've heard Yaesu has least
frequency stability. The specs of a few rigs confirmed this.

> I noticed most people prefered Icom. why?

Icom's larger HT's have all used the same accessories including batteries.
They have a wider battery choice and were first in second source batteries.
Kenwood's current twist-on battery pack on the TH-215 and like are reputed
to have breakable tabs.

> Kenwood wins out in looks too.

I cannot agree. I prefer the simplicity look of Icom.

> Icom wins in accessories compatibilities, and size in new ones.

So I guess you answered your question.

> Yaesu is still good in features (back lit keyboard in 470), and design.

Can you really read EVERYTHING on it in the dark?

> I want a 470 or 24AT later.

You are favoring the smaller size units?

> patents held by Uniden. i.e. - if you want to buy a good scanner,
> it will have to be either made by or licensed by Uniden. I don't
> know what other patents they may hold.

Could you post a description of what the various scanner features
actually do and how they are operated? A lot of times, the "sales
talk" description of these scanning features does not really say
how they really work.

One thing I personally would like in a scanner is for SEPARATE timing
controls on the time to stay while a signal is present and the time to
stay after a signal goes absent. I have seen NO scanner that has this.

Another feature I'd like to see is to allow a single memory to define a
block of frequencies in terms of the frequency step. When scanning hits
this memory, it steps through all the defined frequencies and once done,
goes on to the next memory. It would take but a few memories to program
the complexity of the 2 meter band this way, not to mention the mess we
call VHF land mobile.

Yet another feature is programmable lists, where scanning is performed
via a programmable list of memories (including block ones from above).
Thus I can set up several different scan groups which even have overlaps
and pick the one I want quickly when I want it, rather than have to step
through all the memories and set a SKIP on the ones I don't want.

> I personally think this is a crock - both of those techniques are
> obvious, and one requirement to uphold a patent is that it be
> non-obvious! However, I don't know of any scanner manufacturers

The ECPA does not prohibit receiving specific frequencies; it prohibits receiving specific kinds of communications. The subtle difference here is very important. You can listen to your own harmonic of your own radio transmissions that happen to be in the same frequency band as cellular is assigned, but you may not legally listen to cellular communications even if you happen to catch it on an intermod or harmonic.

There are not enough frequencies. I believe most SWBC stations try to aim their signals to only a small portion of the globe on any given frequency or from any given antenna farm. You might be in a boundary between two of the regions for some services.

> digital capable cellular phones).

Motorola has hired some RF engineers and located them in the same place
where cellular development is going on. The advertising for their jobs
stated "cellular" and "1600 Mhz". These were in some RF industry magazines.

> Of course, since all this is still in the R&D phase, it would not suprise me
> one bit if there are several different systems being developed by different
> companies......they decision to actually implement a system might not be made
> for several years yet.....

And therefore things are not in stone, yet. But certain companies are very
big sway at the FCC, and Motorola is mentioning availability of digital
cellular very soon. I am keeping watch on FCC developments via FR.

> BTW, some people get "antsy" about holding a portable cell phone near their
> head, and these transmit in the high 800 MHz region.....you can bet that these
> same people will be doubly antsy if 1.6 GHz cell phones become available!

That's where salesmen come in. Remember those guys? They are the ones that
have the public convinced that cellular is absolutely secure. They will
simply convince the public that cellular is absoluetly SAFE and make more
profit. Simple, eh?

> Even though I am not a ham, I feel for you fellows....having your spectrum
> stolen is bad enough, but then to be insulted by the Land Mobile industry so

> new digital cellular system. Lots of people who own the presently available
> analog cell phones are not going to rush out and buy a brand new digital
> capable cell phone......they have already made an investment in equipment
> and are going to want that equipment to continue to work.

An article in Mobile Electronics has said that there will be dual mode phones
available because people won't want digital only to begin with. They mentioned
that even if digital can be made as cheap as analog, which is not expected,
that the dual mode would still be even more costly. Yet for some who really
want a channel in downtown LA at rush hour, the cost might well be worth it.

> Also, analog only phones will probably be available for some time after the
> digital capable phones come on the market....the digital capable phones will
> be more expensive at first, but will drop in price as the production ramps up.
> A few years after digital is available, I expect to see all phones offered for
> sale to have digital capability, the result of lower cost of the phones and
> the cell companies' desire to increase the availability of useable channels to
> consumers.

I can believe this.

You might even see salesmen telling customers that the new digital cellular
is even "MORE SECURE than analog", even though analog is still "completely
secure".

> The plans that I have read about will use the standard cell freqs with an FDMA
> scheme, and will multiplex four digital voice signals onto one present 30 KHz
> channel....a kind of FDMA/TDMA system. Each of the new digital cellphones will
> be assigned a time division slot and a channel each time it switches from cell
> to cell, when it is operating in the digital mode. The new digital cellphones
> will be upward compatible with the old system in a fashion similar to the way
> the expanded spectrum phones (832 chanels) are upward compatible with the old
> original specturm phones (666 channels).

And what is the slicing rate? That automatically forces a wider signal if it
is very high. They cannot slice ABOVE the audio range as that would splatter
all over the place. They will have to packetize somewhere in the 100 hz
range.

> The digital cell phones will also be capable of using the analog system, and
> will be agile enough to switch quickly so that a user is not even aware
> (except perhaps by an increase in noise when the analog is being used). Thus,
> as the user of a digital capable phone moves from one cell to another, the

This is a reply to the spate of Yaesu bashing in this thread.
While I have owned every Icom radio imported into this country
at one time or another, the radio that regularly hangs on my
belt is a Yaesu FT470. This radio has been dropped on cement,
stepped on, sat on, and dropped in water yet it continues to
function perfectly. It has more USABLE features than any handheld
that I have ever used. In side by side comparisons with my IC2AT,
u2AT, and IC4AT, it wins in sensitivity and is no worse in intermod
performance than my IC900 mobile rig. It has a METAL case that doubles
as it's heat sink (yes it can get hot if you yak a lot on UHF with
the 12 volt battery pack). It has the best night illumination of
ANY handheld, even the TTpad keys are backlit. The scaning system
is the most flexible I have seen. The ability to work duplex is
superb. It will act as a crossband repeater with NO mods. I have
only two complaints, the belt clip supplied is too flimsy--use an
ICOM clip -- and the internal speaker is too small and inefficent--
use a headset or earphone. If Yaesu fixes the audio and supplies
a stiffer belt clip, this would be the perfect handheld available
for $396. Icom makes excellent radios even if they are stodgy and
pricey, and Kenmore (er Kenwood) makes some cheap HiFi equipment,
but for the best HT for the money the FT470 has no competition.

In article <30500530@ux1.cso.uiuc.edu> phil@ux1.cso.uiuc.edu writes:
]The rumors on this will go on for a while. When the radio does ship
]in the US, its features or lack thereof will tell some of the story.
]If the cellular frequencies are removed, then I personally would urge
]that the radio be boycotted as a form of counter pressure to the
]manufacturers to convince them that buckling under to pressure from
]other sources is not to be taken trivially. There is no valid reason
]to delete any frequency range in the receiver.

Errr.... if they make it trivially easy to restore the coverage (remove
a diode or chip resistor), then I see no reason to flame them. They
(and we) get the best of both worlds: the cell phone profiteers are
satisified and don't further screw things up; and, we still have
full coverage.

I would point out that the cell phone profiteers had enough power in 1986
to get absurd provisions added to the ECPA. They could do it again if
sufficiently threatened. How would you like them to buy congress to
pass a law that said: "Import, manufacture or modification of a receiver
which results in a capability to receive the xxx-yyy frequency range
is a class x felony" or some such rot?

x
TWO SCANNER PATENTS

by Bob Parnass, AJ9S

Here is the information I published a few years ago about two of the scanner patents held by General Research Electronics (GRE), makers of most Radio Shack scanners. You can find out this type of information by spending a few minutes in your corporate or academic law library.

A Channel Lockout Invention

Almost every model scanner sold today provides a way to bypass, or "lock out" channels from being scanned. It wasn't always this way. The first Bearcat scanner, a crystal controlled model with a row of red lights, had no lockout provision.

On February 26, 1974, a U.S. patent was granted to a Japanese citizen for a "frequency skipping system" for scanning receivers. Patent 3,794,925 was granted to Kazuyoshi Imazeki, of Tokyo for a "Frequency-Skipping System for a Signal-Seeking Receiver."

Filed almost two years earlier, Imazeki's development was described as a "switching network" operable "to cause the scanning circuit to skip those frequencies which the operator does not want to monitor."

The need for a lockout circuit was evident: "in some situations the operator may not be interested in receiving one or more of the channels. Unless some provision is made for skipping these undesired channels, the system automatically tunes the receiver to them whereupon the operator must either listen to the undesired channel until it goes off the air or manually advance the receiver to the next channel."

Earlier lockout schemes had drawbacks. The circuitry was "relatively complex and expensive" and had "the further disadvantage of requiring almost as much time to skip a channel as that required to tune to, and through, that channel. In a system having ten or more channels of which only two or three are of interest to a particular operator, a relatively substantial amount of time is lost tuning through the 'skipped' channels."

An example of this slower scheme was the way the Heathkit GR-110 scanner accomplished lockout, by merely providing a switch in series with each crystal.

In Imazeki's scheme, an extra clock pulse was applied to the scanning counter circuit when a locked out channel was next in the scan sequence. This innovation allowed faster scanning of desired channels, by forcing the scanner to the next channel.

The patent assignee is General Research of Electronics Inc.

Priority Scanning Scheme

It was 16 years ago last month that a U.S. patent was granted to a Japanese citizen for a priority scheme for scanning receivers. On April 2, 1974, patent 3,801,914 was granted to Kazuyoshi Imazeki, of Tokyo for a "Priority-Frequency System for a Signal-Seeking Receiver".

Filed almost two years earlier, the system provided for a "signal seeking receiver to automatically tune" ... "to a priority signal whenever it is received. During non-priority receiver operation, a scanning circuit causes the receiver to automatically scan a plurality of predetermined frequencies and tune to a received signal have a frequency corresponding to one of the predetermined frequencies."

In Imazeki's scheme, a low frequency priority oscillator periodically halts the scanner's clock circuit, interrupting the normal scan sequence. The priority oscillator's output is also connected through a multi-position switch, which allowed the user to designate an arbitrary channel as the priority channel.

The circuit diagram in the patent looks familiar. That's because it forms the basis for the priority feature found in many crystal controlled scanners. The assignee is General Research of Electronics Inc.

x
WERE SCANNER MANUFACTURERS PRESSURED
TO LIMIT FREQUENCY COVERAGE?

by Bob Parnass, AJ9S

The 406 - 420 MHz band has long been used by federal govern-
ment agencies for communication of sensitive information.
Until just a few years ago, this range was not receivable on
programmable scanners sold by Electra (Bearcat), Regency, or
Radio Shack.

Speaking at a scanner club meeting in Berkeley, Illinois, an
engineer from Electra confirmed the rumor that it was US
government pressure which persuaded scanner manufacturers,
eager for timely FCC Part 15 certification, to omit this
band from their models.

Tradition was broken in 1982 when Radio Shack imported the
2020 scanner, made by General Research Electronics of Tokyo,
which featured coverage down to 410 MHz. Sales literature
for JIL's imported SX200 even went so far as to openly tell
customers that they could "Tune Military, FBI, ..., DEA,
Defense Department, Justice Department, plus other res-
tricted radio bands no other scanner is programmed to pick
up."

Not to be outdone by the imports, Electra introduced its
American made Bearcat 200 with coverage to 406 MHz.
Regency, whose American scanners were spec'd down to only
440 MHz, made service manuals available which revealed cov-
erage below 440 MHz was possible on all its programmables by
simply striking the "." key before entering the frequency
digits.

Today, government agencies are using digital voice scram-
bling and spread spectrum techniques to ensure privacy of
sensitive communications.

2830. Re: Looking for 2m HT purchase advice.

Newsgroup: rec.ham-radio
Date: 1990-05-14 15:55:27 UTC
From: <>
Message-ID: <15780003@.HP.COM>
Source record: 11686

I have had good luck with both Kenwood and Yaesu (TH-21AT and Ft-411). The 411 uses the same battery packs/accessories as the Ft-23. I also prefer the smaller HT's so that I can carry them in my pocket. Because they are small, I can take them on lots of occaisions where I wouldn't want to have a radio hanging off of my belt. Several times I have forgotten that it is there!. Five other people here at HP in roseville have the Kenwood TH-25AT and are very happy with them. One person has both the TH-25At and the FT-411 in his family. The father prefers the TH-25AT and the son prefers the ft-411. One problem I have worried about with the newer radios is that they in general are more suseptable to intermod and interference because of the wide recieve coverage. I would think that it would be harder to keep IM and interference down on a front end that tunes 40MHz than on a front end that only tunes 4Mhz.

I guess my advice is; figure out what your requirements are and then talk to as many people as possible with different radios as possible. (I would have looked at ICOM more seriously when I bought my Ft-411 if I could have found someone that had one in my area!) If they will let you, play with the radio and see how it feels and how easy it is to operate, whether the controls are solid and in the right place (especially if you are left handed!). Don't forget to ask people where they bought it and if they have had any problem with service.

Last of all, when you get your radio, BUY THE SERVICE MANUAL. They usually cost about $15 and are well worth the cost even if you don't intend to work on it yourself. Buy it now, not three years from now when somthing breaks, the service center is out of copies and has to order it from Japan, or the local dealer says "Gee, I could fix it real soon, but I don't seem to have the service manual for your model .....". The manual is also good for figuring out what that extended receive/cellular/more memory/RS-232/etc mod really does (This may take some work , the manual gives you clues, not answers).

Good luck,

Stan

I have heard something about a new antenna called Crossed Field Antenna.
This antenna is said to be as good as ordinary antennas, but is very
small in size, and can be placed in the desk, at a window. Is there
anybody out there, who has tried this kind of antenna?

Unfortunately, this is not currently permissible. Internet permits the
seven bad words, commercial messages, and any other form of free
expression.

Under FCC rules, an Internet (as in the existing DARPA Internet) Gateway
would need *amazing* computational power to filter each message and
determine if it was commercial for sale junk, bad words, etc.

We were interested in using packet to distribute the UseNet BBS type
of news system that exists on the Internet. While the technology
was not a problem, even for 1 MegaBit Links, the Rules were a
definite obstacle.

Hi!

I talked to the Swedish ICOM rep. (Swedish Radio Supply) today about
the availability of ICOM R1 and R100. They have starded shipping R100s
to their customers now, and expect the first batch of R1's in the
beginning of June. The person I spoke with didn't expect any trouble
in getting the R1 (they are getting the radios directly from Japan).

They have orders on the R1 covering two months of deliveries so if I
order one now, I will get it in the end of July.... There are also a
shortage of R100's, one month delivery time there.

If ICOM in the US are having trouble, perhaps there is a possibility
for some of You to buy japaneese radios from Europe :-) SRS are
accepting major credit cards etc.

(No - I am not paid by SRS to say this, I'm not even sure they're
selling things overseas.)

Would these patents only apply to scanning RECEIVERS or would they also apply to scanning TRANSCEIVERS?

I have a Motorola Saber-III HT that scans with _Dual-Priority_ and _Lockout_ capabilities. Motorola calls this "SaberScan" (of course they also have scanning on their other radios) and has a TM on the name. I wonder if they must license the use of PRIORITY & LOCKOUT?

Also, IMHO, "PRIORTY" is a poor choice of wording for scanners & amateur radios that check a predetermined frequency once every X seconds. I have seen this from 2 to 5 seconds, never faster. Commerical gear, on the other hand, samples the pre-determined frequency several times a second allowing the operator to hear the entire transmission instead of the trailing carrier or "hang-time" of a repeater.

These patents describe circuitry techniques to achieve certain goals that are no longer needed with today's microprocessor controlled scanners.

A feature such as skipping or not skipping a single channel is actually rather primitive considering what could be done in software these days.

Most things. There are a couple of labels on the keypad that you can't
see, but they aren't terribly important.

A nice feature of some Icom HTs is the way the lamp stays on for a time
after pressing the lamp button. I wouldn't mind this feature on the my
470.

Cross-posted to: rec.ham-radio,rec.ham-radio.packet

I need some help from the interference gurus out there. I am trying to set up a portable packet station using a kenwood th-21at, a heathkit hk-21 tnc and a portfolio. The problem is that the portfolio creates a whining sound right around 145.01 and 223.5 Mhz. I doubt that anyone has specific info on the atari but how about some general idea on supressing computer interference that are applicable to the portfolio. I know that the computer is the culpret through the process of elimination, and the realy nice part it that it only interfers when running a program, especially the term program for it. I am going to try some other programs but it's serial port is not quite standard at the low level so I doubt that they will work, also they (the other programs) are very big. The term program for the portfolio is just over 2k and includes xmodem file transfers and programmable function key strings. Oh well, any help will be appreciated.

2841. Need QSL Info

I have a Sony ICF-2002. I notice Sony now sells the ICF-2003.
What is the difference between the two radios? For that matter,
what was the difference between the ICF-2001 and the ICF-2002?
How about it, Sony experts? Can anyone shed some needed light
on this one? --Randy

2844. MFJ address

Newsgroup: rec.ham-radio
Date: 1990-05-15 05:56:00 UTC
From: MCL9337@TAMVENUS.BITNET
Message-ID: <9005150702.AA03349@ucbvax.Berkeley.EDU>
Source record: 11698

Not to try and propagate any ill feelings or anything here, but I bought an MFJ half-wave telescoping antenna for the HT last year for about $16. Though some will say it doesn't help any because you don't have a ground plane, my transmission and reception improved dramatically (ANYTHING beats the ol' stubby dummy load!).

Well, I had this for only a couple months before the antenna came separated from the connector!! This was long, long ago, and I decided to just blow it off thinking how much trouble it would be to get a replacement. Now I think I would like MFJ's address, because I think they may be interested in good PR and might actually ship me a new one. So...

Anyone got the address?? Any stories about how "friendly" they are?

Thanks!

Kenwood makes mediocre Hi-Fi, not too cheap (Yorx from Taiwan is cheap :-)
Kenwood once makes the best affordable tuner for Hi-Fi, you ham guys should
guess the reason of Kenwood experience of RF manufacturing, and instuments
like scopes.

I'm disappointed about the audio of FT470, I wish they fix it since the FT23!
Is it better than FT23 though?

how is it compare to the IC24? audio? freq. range? functions?

Reminds me what a nut I can be/am while at the local Ham Swap Meets. And yes, this might be a long story and no Scott, it has no point.

Being an avid buyer, I lack the spirit in the sales arena. But for a few months I did manage to get out there and try to hustle a buck. To whit, I rounded up most of my boat anchers and fork lifted them into the family ride and trucked off to younder arena at O'dark thirty O'clock in the morning.

...stuff and 3 wasted hours deleted...now the sun is out and I haven't made even coffee money yet. Well, I thinks that maybe these lead piles (did I tell you that these are Motorola Motracs, L recievers?) are getting the proper exposure sitting next to me, stacked 8 high. So I take one of 'um and move it out into the isle, so that folks would, well you know, sorta trip over it and discover precious cargo beneath their feet. Well, it worked right off in broad (sorry, BRIGHT) daylight. This guy picks it up and brings it back to me. What an idiot, he didn't wanna buy it. He thought somebody moved it. DAMB right! I had to lug the pile back out into the roadway. Always some yuck out there tryin' to screw with the advertizing.

Meanwhile, back at the sales lot. Another guy pulls it over to the other side of the seller's space. To my competition no less. Well Chuck is mad now. He's sellin' Micors and some CHP pull-outs with repeater options and he don't like my stinkin' Trac trashing up his neighborhood. He chucks (no pun) it across the road at me. Suc{er wieghs better than 80 pounds. Shoulda blown his arm out, but life's not fair. So I got my Trac back less some heat sink fins. I discretely placed it back into it's normal display location and

more stuff deleted.....

we had great giggles with that Trac. Guess you had to be there to get the idea of how much entertainment from folks tripping over a wayward Trac. Anyway, I wanted to leave the Tracs (all of 'um-didn't sell any) for the management to figure out, but Chuck sez he didn't want to get blamed for the waste, so I took them back home. Figure to use them as cornerstones on my next house.

Then there was the old boat-repeater that I bought just for the cabinet.
Weighed over 200 lbs with the junk technology inside....but that's a longer
story and has no point either.

I have a friend in Paupau New Guinea with whom I would like to
communicate with using packet radio. We both have HF rigs and
will be getting TNCs eventually.

I was planning to use 10 meter HF, but understand only ASCII
data can be transmitted. Is this correct?

I know that binary data could be converted to ASCII, transmitted,
and then converted back. Would this be considered legal, or not?

Does anyone know any networks that work that part of the world,
that would allow me to go through them rather than attempting
a direct link.

Is there a VHF or UHF network link between here(Dallas) and there?

Thanks

John H. Anderson, N5OPY

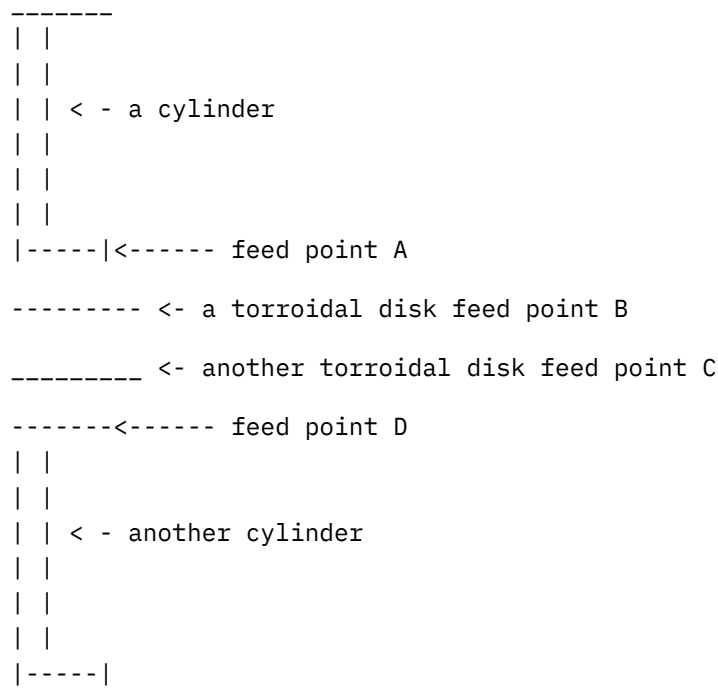
>
> -geh

The Cross-Field Field antenna is purported to be capable of directly synthesizing the Poynting Vector. I don't have my copies of the info at hand but the relivant articles may be found in:

"Electronics and Wireless World" March 1989, Nov 1989 and March 1990.
a "flame" letter may also be found in the July 1989 issue of same magazine.

EWW is a British publication and might be found in some of the large public libraries, particularly those with technical emphasis. Some university libraries may also carry it. BTW, if any one can come up with a copy of the March 1989 article I would appreciate a copy, our library here at work lost that issue.

Schematicly the thing looks like:



The overall height is about 0.7m, cyliners are hollow and about 0.1m in diameter. The torroidal disks are about 0.15m outer diameter and 0.08m inner diameter. I don't know the spacing off hand but a good guess would be about 0.025m. The author split the drive with a phasing network and then used 300ohm twin-lead to feed the antenna. Points B and C are fed by one of the twin-lead feeds (on the inner edge of the torruses (torri?) and points A and D are fed from the other twin-lead. The feed lines come up through the lower cylinder.

That's all I have on the thing from my memory. It looks interesting as an object-d'art as well as a neat summer project. The author claims good results on 40 and 20 meters, possibly as good as his dipole. What we need is some one to put the thing through MININEC and then let's play around with it. It may be as good as the AEA loop.

Has anyone tried using surplus CATV hardline for things like the Army Loop or an home-brew version of the AEA loop?? That might be some neat material for things like that.

Ron Todd, K3FR the PATHFINDER guy

Can MININEC really analyse aerials of arbitrary geometry? I thought
it was only good for line antennas and arrays of line antennas. I
believe you may have to go to the original NEC to get the capabilities
of analysing the CFA. I have been waiting to get some free time to
analyse the CFA by first principles (using a computer to do the
numerical integration, of course -- I am not *that* masochistic,
just barely masochistic enough to try modelling the CFA; maybe :-).

>"Electronics and Wireless World" March 1989, Nov 1989 and March 1990.
>a "flame" letter may also be found in the July 1989 issue of same magazine.

The author of the November '89 article is also selling a kit of the
CFA in G-land. Anyone on the other side of the pond tried it?

>Schematicly the thing looks like:
>

> _________ <- another torroidal disk feed point C
>
> -------<------ feed point D
> | |
> | |
> | | < - another cylinder
> | |
> | |
> | |
> |-----|

An interesting variant (pretty obvious, but also written up somewhere,
I forgot where I read it now) of the above is to cut the above diagram
at the halfway point and installing a perfect ground plane there to get
the mirror of the bottom half. Another variant that occured to me is
to replace the "D-plates" by a slotted loop in this ground plane. If
you go through the field equations, you can see that the H-field generated
by the slotted loop is orthogonal to the E-field generated from the stubby
E-cylinder, satisfying the Poynting-vector junkies :-).

I wonder if there is anyone *seriously* experimenting with the CFA
who could report trustworthy real-world results to the net?

(Ron: send me a FAX number or a snail-mail address. I have the CFA
article you are missing.)

Regarding the differences in audio, and frequency ranges between the FT-470 and IC-24:

Audio - The FT-470 has relatively low audio level. Impossible to hear very well in a noisy car. The IC-24 has a louder amplifier and I feel it is acceptable.

Freq Range - Both radios have expanded VHF coverage (138-174). The IC-24 is easily modifiable to expand the UHF range as well. Believe it or not, following the modification, you will also enable the 800 MHz range. Also, it is possible to expand the VHF range to include the aircraft band (118-138 MHz). The radio includes a built-in am demodulator which automatically switches in/out depending upon the appropriate frequency. How 'bout them apples?

+I have heard an interesting "numbers station" over the past 4 months or so
+and was wondering if anyone out on the NET might have any leads as to its
+location.
+here in Boston. IT ALMOST OVERLOADS MY RECIEVER WITH THE ANTENNA UNATTACHED!
+This station is not coming from Cuba, but most likely from someplace in the
+New England area.
+Another thing that caught my attention a few days ago, was that the announcer,
+who seemed not to have an accent, does have one. She has a Boston accent, one
+I didn't notice because I am so used to it.
+If anyone has ideas, or has heard this station from other locations, please

In short OM, *NO SHIT*?!!:-) Several of us here in So.Cal traced one like this to a "fenced-off" area in the local foothills. The place was a little brick building, with a sloped roof and a heavy-duty looking generator on a small trailer. There was a trailer-mounted vertical antenna and it seemed to be connected to the building with some LARGE size coax (like about 3" dia!) and a few cables...the door was a metal-with-rivets affair. No insignias on the door, a few olive jeeps and a black Ford 4-door-staff car were parked nearby. Outside the fence, we were greeted by a regular-Army Sargent with a nasty looking M16 and told to "go away, and forget you ever saw this place...the whole area is ours...deadly force, next time, bla-blah, NOW BEAT IT!" Uhuh, right Uncle...take it easy, eh? ;-) They escorted our vehicles out of the canyon!

We traced another one to downtown L.A. on Spring Street, that's where the local FBI/CIA offices are...soooo..try looking in the phonebook and start your DFing wherever the local spys 'n' spooks hangout. When you find it, be circumspect, be polite, they have no sense of humor whatsoever and might just shoot or bag you for kicks.

Officially the government has no-comment on these stations but the fact is the US intelligence community uses number stations (just like all the rest!) to orchestrate their covert operations. Once discovered, they tend to move or disappear. The point being: Don't fuck with these people, they'll make your life miserable if you annoy them! Ordinary citizens disappear every day and no one will blame the government if you suddenly don't show up to work/school/etc....be careful!

> Subj: License Fee?

> How much $ does it cost to get a ham-radio license?

The administrative fees for the exams would be as little as $4.95 if you took and passed all the tests you ever planned to take in one sitting.

If you fail a test, you are charged the administrative fee again when you return to retake the test (even if it were the same day at the same place!)

> Do I need to pay to take a test?

Not for the NOVICE. All you need for the NOVICE exam is two GENERAL CLASS or HIGHER volunteers who are at least 18 years of age and not related to you. They are responsible for all the paperwork and scheduling.

TECHNICIAN, GENERAL, ADVANCED, and EXTRA all are administered under the VOLUNTEER EXAMINER (VE) system, and an administrative charge (currently $4.95) per sitting is required. A VE Session is held by accredited Volunteer Examiners (usually associated with a radio club or event). Three VEs must be present and none of them may be related to you.

By the way, you can take the NOVICE at a VE session, too.

> Where can I take the test?
>

VE sessions are held periodically in many cities. If you are not near a town where regular sessions are held, look for a hamfest you can go to. Tests are given at many hamfests under the VE system.

If you know any local clubs or hams, ask them. If there is an electronics store nearby (especially one that carries ham radio equipment!) they will have test schedules posted. A college or universities may have a radio club, and Community Colleges or Vocational Centers sometimes even have classes and host testing sessions.

If you can't find anything obvious, call or write the American Radio Relay League, 225 Main Street, Newington Connecticut 06111, (203) 666-1544.

(We had a guy do that here in Dallas, and they gave him our club's address. Another member and I dropped by his house one evening after work and gave him the NOVICE code and written exams. He passed, and is now KB5MIJ!!)

Or, if all else fails, Email or call me; I can check some other sources for your area.

CHECK WITH YOUR LOCAL VE TEAM REGARDING PREPARATIONS FOR THE EXAM!
YOU MAY BE ASKED TO BRING YOUR OWN PENCILS, SCRATCH PAPER, BLACK
OR BLUE PEN FOR SIGNING FORMS, AND CALCULATOR.

PLAN TO BRING SUFFICIENT IDENTIFICATION (DRIVER'S LICENSE WITH PHOTO
IS GOOD!) SOME VE TEAMS REQUIRE *-TWO-* FORMS OF ID!

IF YOU HAVE ANY LICENSE OR CERTIFICATE THAT PROVES YOU HAVE CREDIT
FOR EXAM ELEMENTS YOU SHOULD BRING *-BOTH-* THE ORIGINAL AND A
PHOTOCOPY SINCE A COPY WILL NEED TO BE FILED WITH YOUR APPLICATION.

YOU ARE NORMALLY GIVEN ALL THE TIME YOU NEED TO FINISH THE EXAM.
PLAN YOUR TIME ACCORDINGLY. ARRIVE ON TIME OR A LITTLE EARLY.

> The above questions sound silly, but I am learning morse code and planning
> to take the test soon.
>

No, they don't sound silly. Everyone has to learn somehow, and this is a
good place to ask.

Actually Phil, they're on VHF around 167 Mhz. (You can also know the exact frequency by asking around or by checking out some of the "Secret Government Freq. Listings" directories. Don't get your hope up too high - they're on DVP mode - all you'll hear is white noise when they transmit and a short tone burst at the end of every transmission (this let's the agent know that the DVP feature on the radio is still working - the DVP "Key" is easily erased by dis-connecting the battery when the radio is on). This "key" is a 64 bit algorythm developed by Motorola. It's based on the NIST 72 bit Data Encryption Standard (DES). The NSA rolled it's own form of voice encryption code named "Fascinator" used by the President and "above". Some agencies are now using another high level encryption method called RSA. Unless you have a super-computer and know how to tackle the problem, this stuff will remain encrypted the way it was meant to be... there's always the Japanese who might put "DVP decoding" features in their hand-held scanners one day.

Geez! I wish people (like you) would be just a little more conservative
in their remarks concerning other manufacturers equipment, especially
when you admit that you have never owned a Yaesu!

I won't comment on all of the HT's available on the market, however, I
would like to say that I am ESPECIALLY pleased with my Yaesu FT-470 dual
band HT.

This rig has everything! built in no less without ANY additional expense.
It is nearly as small as the ICOM IC-24 (appearances can be decieving),
has built in encode/decode, crossband repeat and extended vhf recieve
without modification. The list of features goes on and on. Yaesu did
have a problem with intermod on early versions of the rig, but that has
been fixed and they are upgrading older units.

The best part is the radio is commonly available for less than $400.

Now if I could only find a mobile rig that does all that the 470 does..
sorry folks... it isn't available, not even from Yaesu (dumbies!).

Two other points, the intermod problem that all manufacturers are
suffering are due in large part to the demand by Amatuers for extended
recieve on their HT's. If you open up the front end to allow extended
recieve your bound to suffer intermod to some degree or another.

Final point.... all of my vhf/uhf gear has historically been ICOM, but
you can't beat the 470 for all around performance AND price. ICOM's
nearest is the IC-24 at $570+, and then you still have to buy extras.

Heck... I liked it so much I bought two!

How much power can a piece of coax handle? Well, it depends on what is at the
end! With a perfectly matched load, your coax will actually handle a lot
more power than with a mismatched load. Mismatch generates standing waves
(hence current and voltage nodes) due to the energy reflected from the load.
A perfectly matched load absorbs all the energy fed into it, so no reflection
and no standing waves. This state of nirvana is rarely, if ever, achieved in
the real world, despite what antenna makers wish to tell us.
I have pushed 400 watts down a length of RG58 when it has been properly matched
(that is, feeding a dummy load) yet similarly i have seen flashover
at 200 watts on the same feedline with chronic feeder mismatch (open circuit
at antenna feedpoint;. Oooer!). Of course, feeder losses will also increase
with increased mismatch - the ultimate feeder loss being when it flashes
over or cooks the dielectric... exit one length of feeder :-)

>to the RS232 of the computer. Is this real? Are they still working
>on the project? Does anyone know?

I don't know if it is I that you were referring to, but I was designing such a widget. It turned out to be MUCH easier to build an on-the-PC-bus card for driving a rotor, with a TSR to drive it. What you need is an Analog-to-Digital Converter to read the rotor position, and a couple of bits of parallel port to drive the rotators.

I built mine from a JDR Microdevices PC breadboard card (the one with all the bus interface and address decoding on the board already), an ADC0809 chip, an 8255 chip, and some transistors. Total cost, around $30 or so. Took an evening to build it.

Software to drive it took another two evenings; it's a short program in assembler that just samples the ADC and compares it with a desired value that's fed to it from the InstantTrak tracking program. It's compatable with the Kansas City Tracker calls that IT uses; if you're using some other program it might not be.

I'm planning to add two serial ports to the card (probably an SIO or a dual 8250 or something like that) so that it can talk to the controllers inside my radios and do tuning and such. Haven't done that yet; part of the reason is that several of the tracking program principals aren't yet in agreement over how to pass the value for 'range rate' (change in distance between you and the bird, which determines the doppler shift).

Hi. I am a member of Group 70 which is building a large amateur astronomical observatory. We eventually intend to have it completely automated (remote controlled ?) and need a very accurate clock for the observatory.

I believe that NIST?(NBS)transmits a very accurate clock on 60khz, Could someone give me information about how I could use this to calibrate a local clock? We need absolute time that is accurate to better that +- 300 microseconsd of course, greater accuracy ie even better for astrometric purposes.

I have looked at a 8 year old copy of the 559 manual but it makes no mention of the 60Khz signals.

Thanks

2882. DAK MR-101 receiver summary

Newsgroup: rec.ham-radio
Date: 1990-05-16 19:27:18 UTC
From: jvb7u@astsun.astro.Virginia.EDU
Message-ID: <1990May16.192718.22219@murdoch.acc.Virginia.EDU>
Source record: 11582

OK, OK, enough! I'm tired of seeing requests for info on the DAK receiver, so I decided to pare down my file on it and post what I have along with my own observations (mine arrive on Monday 5/14). First, my observations:

It's noisy and not very sensitive. I guess it works better than my old Heathkit GR-64 five tube set, but definitely not up to the better sets. With a 50 foot long wire, it is not the equal to my Hammarlund HQ-180 with a 3 foot wire dropped on the floor. The Hammarlund was pulled from a dumpster and with the exception of cleaning, straightening the tuning cap plates and replacing the VFO tube, it hasn't been touched. I have no idea how out of alignment it really is.

AM and FM performance is VERY bad. My daughter's $39 Emerson boom box pulls in stations (and sounds better) than the DAK set. Sound quality is harsh and garbled on some stations.

I monitored a pile-up on 40 meters last night with my Hammarlund. It was able to separate stations quite well with the 2kHz selectivity. The DAK was hopeless.. my guess is at least 10 kHz selectivity. I also tuned it WWV at 15 mHz with a good signal and found an image at 14.100 mHz that was almost as strong as the original. Reminds me of the GR-64 ;`) I also get an RTTY signal on the AM band at 1260 kHz, so image rejection there must be poor also.

I also monitored several stations that had severe fading. The ANL on the DAK radio has about a few second time constant, so that it didn't help much. The Hammarlund worked fine!

My recommendation: If you're a casual listener and don't care to listen to anything but strong stations (WWV, VOA, BBC, etc), this is a bargain, otherwise, look elsewhere.

I've had one for two weeks now. I ordered it because of the digital frequency readout, and that 'PLL' stuff that supposedly is the best for SW (although I don't excatly know what it is).

However, the shortwave is disappointing. I don't know if it is the receiver or the antenna, or something else. I have a 14 year old Telefunken radio casette, and although I have to play patiently with the analog dial (and never know what frequency is exactly tuned), I usually get the Deutsche Welle as clear as a bell, whereas on the DAK I often don't get it at all, or it's with a noisy background.

I'll keep the DAK, though, for other reasons. It's a neat little AM/FM receiver with digital frequency readout and station buttons, and it's also a radio alarm clock (when it's turned off, you see the clock in the digital display). It has adapters for AC, external antenna (for better shortwave reception, I suppose), and headphones). With good headphones, it has a reasonably good sound, and the amplifier has plenty of reserves you'll never use.

Regards

Subject: Re: Request for Info on DAK radio

Kavan:

No, it has just one timer. Actually, the SW is not quite as bad as I may have described it. Especially if you go outside and play around with the antenna, you get quite a few stations, at least in the 49 m band (my favorite band), with reasonably low-noise reception. So the problem may actually be in the antenna; at this point, I don't know.

On the other hand, my old Telefunken keeps astonishing me. When I bought it in 1976, I didn't even worry about shortwave, I just needed a portable radio recorder. Then I find that it has not only quite good short-wave reception. You'd have to get an expensive stereo to match the sound quality (over good earphones). I really wish I'd find a similar compact unit with all these qualities, PLUS digital frequency readout. ... Well, just got carried away a bit.

Regards,
Peter

Due to popular demand, here are some details about the $50 DAK MR-101. First, I was positively surprised to find that the small unit (7 x 4 1/2 x 1 1/2 ", one pound) not only had an external antenna jack, but also a headphone jack and a connector for a 6V DC power converter, such that you don't have to 'subside' on batteries alone. Normally, the thing is powered by six AA cells.

The amplification is more than adequate, and the sound is reasonably adequate with headphones. When it is off, the time shows in the LCD display, with a 'ticking' mark for the seconds. So far (for about 2 weeks), the clock has been accurate.

Shortwave tuning is in 5 Khz increments. There is nothing to show signal strength. Since I don't have much experience with SW radios and nothing suitable to compare it to, I submit a test of the 49 m band (5,800 to 6,200 Khz). The test was done at 9:30 p.m. EDT in Columbus, OH. I am listing the stations with what I consider 'usable' reception. That includes stations with various levels of background noise, but not that much that you can't make out the actual broadcast anymore. I just categorize them into 'relatively noise-free' (default) and 'noisy' (I did not attempt to identify the stations - just happen to know that at 6040 Khz was Deutsche Welle).

Khz	reception
5850	noisy
5945	noisy
5950	
5960	
5975	
5980	noisy
5985	
5995	
6040	
6050	noisy
6130	
6145	noisy
6165	
6175	noisy

6180 noisy
6119

Some stations came in as clear as a bell. On other days, and later at night, I received Deutsche Welle at 6075, and Swiss Radio Int'l at 6135 (the latter a bit noisy).

I hope this amateurish benchmark test gives the pros among you some idea about the DAK. Given the above, I would also like to know what YOU think.

I received my DAK radio, finally, this afternoon. Here are my first imressions:

The sensitivity seems pretty decent. Something similar to Sony 2001. I was able to receive BBC (15260), RA (21470) and some other station. A notable one was All Idia Radio External Service at 1300 UTC on 15110. The weather and prpagation were good today. I have thirty days to see whether it is worth keeping.

On the negative side:

It has two bands The upper band starts at 9500 and goes to 26000. So some of the 31 meter stations (like 9400) cannot be picked up.

It does not have direct tuning. So it is not very quick to go from one station to the other unless it is one of the six preset frequencies.

The frequency steps are in 5 kHz and not 1 kHz.

All in all it seems to be good radio to take along to office or on atrip so as not to miss your favourite BBC sports roundup or some some such program.

It is made in China and I do not know if it is a licensed clone of the Phillips radio.

I'll give a detailed account of my impressions in a day or two if
nobody does it so by then.

I heard a review of the DAK receiver on Radio Canada International this
evening. I don't remember all the details, but there were pluses and minuses.
It's apparently a very good deal for the $49.90, but there are some caveats: 1.
it's made in the PRC (they're having cash flow problems since that little
`incident' with the tanks, not surprisingly), 2. there's no tuning knob
(instead they have a few station select buttons and a couple of buttons to scan
with), 3. it's not very sensitive (apparently only people in coastal areas
will do well with reception), and 4. the 5 kHz jumps between frequencies limit
its useability outside of North America. Caveat number 1 was enough to kill it
for me.

Disclaimer: I am only reporting what I remember of the review. I have never
seen the DAK receiver myself, and have nothing to do with DAK or the PRC.

Hello world!

While playing around with the DAK I discovered some strange anomolies:

1. It performs quite well WITHOUT its antenna extended.
2. When I use the antenna, its reception improves marginally (if at all).
3. When I use an external antenna and plug it into the external antenna
socket, its reception DEGRADEs dramatically.
4. When I attach an external antenna to the regular antenna, reception
improves.
5. If I partially insert the external antenna into the headphone socket,
reception improves.

To give you an idea of how it performs: I compared the DAK with a SONY SW1S
and a 2001 and found that the reception on the DAK is much worse than the
SONYs. As noted above, my DAK without its antenna extended receives better
than the SW1 without its antenna but then who cares about that?

Further when I tuned into BBC at 5975 Khz, the DAK added a loud whine to
the BBC transmission. I'm certain this whine is introduced by the SW rather
than some external source because neither SONY picked it up.

All in all I'm pretty disappointed by the DAK. I'd like to know what other
people feel about their DAKs - maybe I got a lemon. I suspect that my
antenna is grounded. Any suggestions, comments?

Well, my $50 DAK radio has conked already. The Power switch stopped working,
so I used the "Sleep" button to turn it on, and even that went today. I
can not turn on the radio now at all. It'll go back to DAK today.

What I'm wondering is -- how is the $200 unit by Sangean that DAK advertises
in its latest catalog ? The one with direct entry tuning and so on? How would
that compare with the SONYs/PANASONICs in that price range?

Thanks in advance,

Vibhu Mittal

>...The DAK is not
>the Philips AE-3805 (although my bet is that it's a clone!)...

Right you are. I had hoped to post a review of the receiver by now, since mine finally came last week. Unfortunately, I had a case of infant mortality: somethings blown in the radio's amp, and even turning it up full blast I barely get any sound.

Since it could have been a simple short or loose wire or something, I couldn't resist opening it (if anybody tells DAK, I'll scream since I'm returning it). The answer is:

ACE ELECTRONICS, China. Printed on the circuit board.

Mini review:

The radio *feels* cheap. The volume slide pot is extremely wimpy, and slides all too easily. The keys and case are all hard plastique, no texturing, which combined with the light weight, also adds to this perception. The "dial" light is almost no help, illuminating the edges of the display too much and not enough on the center. It also created an audible pop when I hit the "Light" button, but that may have been an artifact of the other problems my specimen had. The speaker is real wimpy, I wouldn't expect much fidelity of any sort (.5 watt amp 8 ohms, 2 inch speaker); there's no tone control.

Basically the radio has all the advertised features, and they all work. The central computer module, which I bet is OEM'd from Phillips, has all the features of the Phillips radio including standby, clock, timer, alarm, etc. I don't understand why the "Lock/Unlock" key is there. It's in the same place as the on/off, the same kind of switch, and doesn't stop the radio from turning on anyway, just from changing freqs. When the radio is off the display shows the time, and when it's on, you can toggle from time to alarm to freq display. The major controls were all unbelievably wimpy in design (on/off, lock, volume) except the "computer" keys (tuning, alarm, memory) which are a rubber membrane with studs shorting points on the upper computer circuit card).

From the little I could hear, the radio could get the major stations, but was much susceptible to noise (no shielding and a dozen patch wires on the circuit board) and fading. So I'm used to my Sony 2010, and it's wonderful Synchronous circuit, sue me. I heard to BBC (5975 & 9640, Moscow(15425) WWV (5&10) and Australia on 9580. Fine. I could get these with a tin can with an antenna, but it lent credence to the fact that this really was a SW radio.

I couldn't hear CFRB (6070), Tahiti (15171) or anything of moderate DX difficulty, but given the radio was barely putting out any sound, I can't tell whether it's the radio design defficiency or the audio amp problems.

Tuning via the slew keys takes some getting used to. Holding the slew key puts the radio into a scan mode, stopping at loud stations. If you want to stop at a particular frequency, you have to time it right and hit the opposite slew key to stop the radio from scanning. The memories worked, but there is no backup battery - you lose the settings whenever you change batteries :-(.

Now for the real test. I get to return it and see how long it takes to get a replacement or repair from DAK. So whaddya want for $50?

I suspect the DAK radio performs just about as well as the thirty nine cent cigarette lighter I just purchased at a local drugstore. Made in China and --you guessed it-- no flame no matter how many times you flik! Maybe if I attached a long-wire . . .

At least you stand a chance of getting your money refunded.

As for the lighter . . .

You get what you pay for...

DAK shortwave radio for $49 is not very sensitive, but does lock onto the stations reasonably well. The FM sound is very good, but alas, it really is just a fifty dollar shortwave radio. Its battery consumption is surprisingly high, and the unit is not stable on the table (it tips easily). It serves

well as a second portable, but one of the first things I had to do for it was purchase an AC adapter from Radio Shack (approx. $8).

For serious portable shortwave listening, I recommend Sony Pro-80 ($350-$400).

I don't know if amateur radio is subject to different regulations than
other services, but I should point out that HBO is transmitted, via RF
frequencies, by satellite, to home viewers (TVRO). I don't quite catch
the distinction that would allow this and preclude Internet-originated

transmissions.

The difference is the Amateur Radio regulations.
For one thing, business communications are not permitted.
For another thing, the originating station is supposed to have control over
any transmissions from his station. This means he must read each message
before it is transmitted.

I believe internet messages COULD be sent over Amateur packet radio if
the originating station licensee were willing to read 1000% of the messages
before they are transmitted.

The Secret Service currently uses Motorola radios with DES based
DVP security mostly on a group of frequencies in the 160-170 mhz federal
segment. As far as I can tell, the frequencies are mostly the same old
phonetic alphabet channels (BAKER, CHARLIE, DELTA, GOLF, NOVEMBER,
OSCAR, TANGO, SIERRA) that they have used for the last 40 years for
presidential protection. I do not have a list of the frequencies here
at work, but if someone is interested I can look them up. There has
been some realignment of the 160 mhz federal frequency spectrum by the IRAC as
more and more federal stuff shifts to secure modes such as DVP and more
flexible operation such as trunking. This may have resulted in some
reassignment of traditional 160 mhz secret service channels, but they seem to
have been using the old standard ones pretty regularly too.

Communications on the presidential protection channels are mostly
all encrypted now with DVP, but occasionally someone will transmit
a message or two in the clear. The secret service also has available
some assignments in the 409 and 414 mhz areas - as far as I know these
are not heavily used for presidential security. Much of this 406-420
mhz band has been restructured and the old secret service frequencies here may
and may not still belong to the secret service any more.

DVP is FSK modulation (frequency shift about 8 Khz or so) of DES
encrypted CSVD digitized voice. My recollection is that the bit rate is
16 kbs. The system is pretty secure, since it uses DES in a cipher
feedback mode, and the keys are changed every month or so (or so I have been
told). The radios all have dual secure/clear mode capability and
appropriate squelch circuits so communications can be sent either in the
clear on NBFM voice or secure on a transmission by transmission basis.
I think they either have a secure push to talk and a clear push to talk
or a mode switch since one occasionally hears one half of a conversation
in the clear and the other half secure. To untrained ears the DVP
signal sounds like white noise, but it will unsquelch many scanners.

In addition to the presidential protection channels now rendered
largly useless to scanner freaks there are channels that the secret
service sets up for coordination with local law enforcement. These vary
on a city by city basis, but often have quite a bit of activity on them.
They are often secondary frequencies licensed to local or regional police

agencies and used during special events.

And of course for the hard core, there are the various radio-telephone systems used by the president and vice president as well. I have posted descriptions of these to the net at various time in the past.

>> Refs to Crossed Field Antenna

There is an article "The Cross-field Antenna in Practise" by C.Bryan
Wells in the English magazine "Electronics World + Wireless World"
November 1989 pp1109 - 1111 in which the author describes his experiment
and comes to the conclusion that it really does work.

He's using an antenna made of tinfoil covered milk powder tins (REAL
ham-radio :-) which gives a size of 700mm (about 2 feet 6").

I quote (he's talking about using the antenna on 40m):

... " At night the results are almost as good as both my double zepp
and an 82m (meter) circumference vertical loop, both at about 10m (32ft).
The full-sized (700mm) CFA is mounted against the peak of the roof space
in the house at about 8m (20ft) above ground"

--- the bits in parentheses are my additions

He then goes on to describe various checks to ensure that the CFA really
is doing the radiating and not just acting as a bit of metal at the end
of a feedline and comes to the conclusion that it really is radiating.

The person in the next office informs me that there's another article in
the latest issue but I haven't seen it yet.

Cheers
Giovanni ZL2BOI

2888. E. F. Johnson Viking Ranger [restoration]

Newsgroup: rec.ham-radio
Date: 1990-05-16 23:21:53 UTC
From: guhsd000@crash.cts.com
Message-ID: <2693@crash.cts.com>
Source record: 11588

I've wanted to have a Ranger for some time, mainly because I always liked the way it was set up, and the broad coverage.

to have been plugged in since 1975, judging from the decayed rubber of the power cord and a service tag. Over all, it's on great shape, I doubt I'd look that good after being sealed in a box for 15 years.

Major problem: The band selector was frozen, now it's really high drag, I can fix that, but the knob, and the cam (inside that shifts a pot[core/switch?] as the shaft turns.) have both become loose. Anyone know what position these should be in at 160 meters and 10 meters?

Also, I could use the pinouts for the crystal socket(and other crystal info for it's use), the jumper socket on the back, the phono jack in the back (Best guess s
is for the key.) And the shielded plug, which I belive is the mike jack.

At full drive, what is the rated power out? And a good antenna for such a widebander? A 160m wire is pretty much
out of the question.

Thanks in advance.

Funny. I don't want to spoil your business, but I just want to share something with you guys over ther in NetLand. Keep your eyes open and you can make some *real* deals.

A couple of weeks ago I found out that a local hospital was dumping their VT-52-compatible terminals (new ones coming in, of course) and had no idea what to do with 'em. Unfortunately, they decided to literally dump them - and when we got there, only few were left.

Well, one dollar (approx.) per terminal wasn't all that bad. And those TT-43's we got three for $2.. kinda quantity discount.

Terrific fot packet, work like a charm. I sure will keep my ears and eyes open and act quicker next time.

2890. Priority Scan.

Newsgroup: rec.ham-radio
Date: 1990-05-17 08:39:36 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <17.May.90.09
Source record: 11589

I agree a 'priority' sampling rate of several seconds is quite silly.
What is *really* needed to implement this properly is a second, independent
receive channel for the 'priority' frequency. Yhis receiver sits on its
allotted frequency all the time, listening. Then by some simple logic,
you just switch the audio from one receive strip to the other when the
'priority' squelch opens.
This is quite common on marine receivers where they have a 'watch'
receiver on 2182KHz (or the other distress frequency - 500KHz isnt it?)
which is on all the time.
If it can be done with dual-band ham rigs, how long before some smart
manufacturer does it in a scanner?

2892. Query on PRO-34 frequency mod

Newsgroup: rec.ham-radio
Date: 1990-05-17 12:06:56 UTC
From: dan@heimat.UUCP
Message-ID: <112@heimat.UUCP>
Source record: 11596
Cross-posted to: rec.radio.shortwave,rec.ham-radio

[-=-]

Well I finally decided to do the 'euro' mod to my PRO-34 (restore the 66 - 88 MHz range). Based on the collection of PRO-34 mods I collected from the net I added a diode to D-9 (the old one removed from D-11 when I restored full 800 Mhz). It appears as though I now have this new range of frequencies -BUT- at the cost of my 30-54 MHz range :-(

Its an easy job to remove the diode and be back where I started but my question is: Has anyone been able to get both? Does anyone actually use or check these mods (in particular this one)?

One other note on the PRO-34, a few nights back while busy with other things I wanted to place the scanner in manual and select channel 21. Not watching what I was doing, I somehow got the scanner on channel 210! At this point I could step with the manual key and the #'s kept going up. When I pressed scan it continued going up unitl the PRIORITY kicked in. Since then I have not been able to reproduce this, has anyone had any luck with extra channels? (Oh yea - these new channels were all set to "0.0" while my original 200 remained programmed)

I also agree with Scott. My pro-34 interupts normal scanning every 2 seconds
to monitor the priority channel. This is a very annoying interuption to have
to contend with if nothing is happening on the priority channel.
I would rather have a scanner that doesn't interupt normal scanning unless
a carrier is present on the priority channel. As it is now, the pro-34
interupts regardless. It wouldn't be so difficult to have circuitry
monitor the priority channel to see if a carrier is present and if it
is then and only then go to it. I believe some of the later bearcat scanners
are doing this.

I just picked up a Kenwood TR3600A with DCS. I'd like to program a
paging function into my repeater using this technique. Unfortunately,
the manual sez little about how this works.
[stuff deleted]
I'm also interested in why the scheme never caught on. I don't think
I've ever heard the digital bursts on the air.

Sorry, I can't help you with the technical info on DCS.

I believe that it never caught because it was a single-vendor
solution and one which did not allow easy upgrade/capatability
with existing equipment.

Kenwood has recently put a DTMF squelch system in the TH-26
handitalkie. (ICOM has put this in a few rigs also.) This
makes alot more sense to me. Anyone with a DTMF encoder can
call you if they know the magic sequence.

Another vote for a IC02 AT/E as a good buy for a second hand HT

I have been using the European version IC02E for 5 years now. It has had a hard life, and has been a trusty companion. I use it for hill-walking and backpacking, its small enough and light enough to be a 'must' in the rucksack.
I have operated in rain, snow and temperatures from -10 to +30 degrees C. The NiCd's had a bit of difficulty at -10. It is ruggedly constructed with a metal back and anti moisture grommets on all the knobs.

Disadvantages: Only got 10 memories, repeater shift a pain to program, scanning is funeral procession speed.
Advantages: External DC/mic/speaker if you want. Standard ICOM batteries reasonable power (3W), good reports of audio from internal mic. Can extend receiver coverage to 138-163MHz.

2897. Re: DAK MR-101 receiver summary

Newsgroup: rec.ham-radio
Date: 1990-05-17 15:33:20 UTC
From: elliott@optilink.UUCP
Message-ID: <3633@optilink.UUCP>
Source record: 11600

Briefly...

We took one of the DAK MR-101 rcvrs outside and compared it's performance to a Sony ICF-2003. Immediately obvious was the DAK's low audio level (this was using the built-in whip antenna on both units). We plugged the Sony long-wire antenna (hardly a long-wire electrically, but you know what I mean), into both radios and noticed that the Sony output changed little, but the DAK's increased dramatically. The AGC on the DAK seemed marginal, either a poor control range/slope or a ridiculously high threshold. The audio quality was not much worse than the Sony.

With the external antennas, both radios seemed to have similar sensitivities. All this testing was done at 3:00PM PST, receiving stations from 5MHz to 21MHz. The comments made in other postings seem to match our experience, especially in regards to the lack of "quality feel" to the radio.

2898. IC-24AT Receive Mods

Newsgroup: rec.ham-radio
Date: 1990-05-17 15:54:21 UTC
From: kenw@col.hp.com
Message-ID: <24300004@col.hp.com>
Source record: 11612

At the request of several interested hams, I am posting the modification instructions for the Icom IC-24AT. This set of instructions originated from Icom America and was downloaded from the Icom Library of HamNet (Compuserve).

Ken WA6TTY (kenw@col.hp.com)

IC-24AT Undocumented Features - (from ICOM)

The IC-24AT dual band handheld had three additional features that are not described in the owners manual. These have been left out of the owners manual because some countries restrict the use of the radio in these modes.

AM AIRCRAFT RECEIVE PLUS 740 to 960 MHz RECEIVE

Remove D13 from the main logic board (this diode may already be removed by ICOM in some units). This diode may already be removed in some radios. D13 is on the main logic board and is a discreet diode (one of the two in the radio) near the center of the board. It is the left discreet diode of the two on the board when the radio is open and held with the controls away from you.

Simultaneously hold "Light", "B", and "#" keys depressed and turn power on.

It is important to note that the radio will not meet specification on the out of band receive frequencies that are enabled with this modification.

DIRECT KEYBOARD ENTRY of 100 MHz FREQUENCY

Simultaneously hold "Light" and "3" keys depressed and turn power on.

CROSS BAND REPEAT (simplex)

Remove D14 from the main logic board (this diode may already be removed by ICOM in some units). The diode is a discreet diode to the right of D13 (from above) and directly beside it.

Simultaneously hold "Funct" depressed and push "C".

To turn on cross band repeat:
Hold "Funct" depressed then push "5" and then push "D".

To turn off cross band repeat simultaneously hold "Funct" and "D" depressed.

2-14-90

2899. Re: IC-24AT Receive Mods

Newsgroup: rec.ham-radio
Date: 1990-05-17 16:07:15 UTC
From: kenw@col.hp.com
Message-ID: <24300005@col.hp.com>
Source record: 11610

Following the frequency expansion modification (as specified by Icom), a sample IC-24 was recently tested for tuning range and input sensitivity for an S9 signal. While the sensitivity measurements should not be directly compared with the manufacturer's specifications (usually measured reference to a signal-to-noise quieting ratio), this "quick and dirty" data should give you a good idea of the sensitivity to a medium-strength signal.

Tuning Range Mode Band Sensitivity for S9 Signal

74 - 107.995 MHz (fm) VHF range approx 1 mV
108 - 136 MHz (am) VHF range 10 - 30 uV
138 - 240 MHz (fm) VHF range 1 uV - 1 mV (1)
250 - 302 MHz (am) VHF range 50 uV - 1 mV (2)
310 - 354.995 MHz (fm) VHF range 50 uV - 3 uV (2)

355 - 409 MHz (fm) UHF range 3 - 10 uV
417 - 490 MHz (fm) UHF range 1 uV - 100 uV (3)
805 - 955 MHz (fm) UHF range 10 - 100 uV

Notes:

(1) The sensitivity from 138 - 150 MHz was 1 uV. From 150 - 240, the sensitivity decreased almost linearly from 1 uV to 1 mV (with input voltage plotted logarithmically).

(2) The sensitivity increased almost linearly for both these ranges (with input voltage plotted logarithmically).

(3) The sensitivity plot looked like a "U" with the bottom of the "U" corresponding to the range 440 - 450 MHz (1 uV). The sensitivity then got worse below 440 and above 450.

From: Joel_Glickman@MTS.RPI.EDU
Message-ID: <1820962@MTS.RPI.EDU>
Source record: 11616

While the subject of Internet->Packet gateways is floating around netland, perhaps this is a good opportunity to ask people's views about a Modem->Packet server. I have set one of these up whereby I can call in from a terminal on a phone line and access my station. I have also allowed other ham friends to do the same. I believe it is legitimate remote operation when *I* am operating with my callsign from a remote terminal. Is it within the regs to allow fellow hams to access this system and use their callsigns on my TNC to connect to packet BBS's... etc..??

2902. ** Another Novice Question **

Hi,

I have a question I am hoping the HamNet can answer.

If you take the NOVICE test and pass can you immediatley take
the TECHNICIAN test, which I believe is just another written test ?

If you pass that can you immediately take the GEN test ?

thanks in advance,
Mel

John,
I cannot help with you your clock question but I wish to mention
that SKY AND TELESCOPE some 3-4 years ago (don't quote me) did an
article on a person in the southwest who built a completely
automated observatory on his property (in UTAH?). I don't
recall anything beyond that but suggest you ask S&T the details.
They may point you to who that individual is.
good luck,

> the way I want. I can auto-search over and over without logging the
> freqs I already know about. etc. etc.

Can you have it stay on the frequency as long as there is a signal for
up to 30 seconds, and have it stay after the signal is lost for up to
2 seconds? Does the computer get to control things at this level? Does
it get to know when a signal is present and gone instantly?

I gather there are some unusual political problems with third party agreements. Last time I looked we had them with countries like Cuba and Nicaragua, but not with Great Britain or Germany. It seems to me that the biggest reason a country does not is the paranoia that it may lead to long distance telephone revenue losses.

RECEIVING TEST:
The CW/Phone/RTTY broadcast will begin with a 10 minute tuning call and will precede each trans mission. The CW test will be transmitted at 25 words per minute beginning at 0300 UTC May 19. The phone/RTTY broadcast will begin at 0345 UTC May 20 and transmit at 20 wpm using 170 Hz shift. Both broadcasts will be transmitted from the stations below:

AAE: 4018.5, 6988.0, 9990.0
AAH: 4021.5, 7309.5, 13994.5
AIR: 6995.5, 13997.5
NAM: 4005.0, 7393.0, 14400.0
NAV: 7372.5, 14389.5
NPG: 7365.0, 13975.5, 24805.0
WAR: 4030.5, 6998.5, 14403.5

SUBMISSION OF TEST ENTRIES:
Transcripts of the CW/Phone/RTTY receiving tests should be submitted "as received". No attempt should be made to correct possible transmission errors. The time, frequency, and call sign of the military station copied as well as the name, callsign and address of the person submitting the entry must be

included on the page containing the test message. Entries must be postmarked no later than May 27, and submitted to therepective military commands as follows:

STATION COPIED ADDRESS
AIR Armed Forces Day Test
2045 CG/DOJM
Andrews AFB, MD
20331-6345

AAE, AAH, WAR Armed Forces Day test
Commander, USAISC
ATTN: ASOP-HF
Fort Huachuca, AZ
85613-5000

NAM, NAV, NPG Armed Forces Day Test
Naval Communication Unit
Washington, DC
20397-5101

The above information was extracted from the May 11, 1990 issue of the AFCC Intercom, the newspaper of the Air Force Communications Command.

My apologies that I didn't get this uploaded sooner.
Good luck in the Armed Forces Day test.

PLEASE REMEMBER: DO NOT TRANSMIT OUTSIDE OF THE AMATEUR BANDS.
THE MILITARY STATIONS WILL BE ANNOUNCING WHAT FREQUENCIES THEY WILL BE LISTENING TO WITHIN THE AMATUER BANDS. THIS WILL NORMALLY BE IN THE LOWER PORTION OF THE GENERAL CLASS BANDS.

73,
Michael, WA7SKG

2912. AEA Loop Antenna

Newsgroup: rec.ham-radio
Date: 1990-05-18 03:16:19 UTC
From: whester@nyx.UUCP
Message-ID: <965@nyx.UUCP>
Source record: 11605

Several months ago I purchased the latest A.R.R.L. Antenna Book (blue cover, 1988 copywrite) and found a fasinating article on small loop antennas tuned remotely by a motorized capacitor at the high impedance point in the loop. This article is "Small High Efficiency Loop Antennas for Transmitting" on page 5-11 of the Antenna Book.

What was so special was the data listed for several sizes and the very high efficiencies claimed. Well, I hummed and hawed and was still "thinking" about possibly building one (if I could figure out a neat cheap way to build my own variable capacitor that could withstand the very high voltages developed across it)...when AEA advertised a small loop with remote tuning, etc.

So far I have not seen any prices...is this a real product...available for shippment?...or is AEA just testing the waters to see if there is any interest before starting production?

Anyway, has anyone actually built the antenna described in the Antenna Book? I
I'm considering it for use in an attic with foil backed fiberglass insulation used as the groundplane as described in the article.

Please post to this newsgroup. Thanks. Bill, N0LAJ, Denver

2913. Looking for a dual band HT + misc

Newsgroup: rec.ham-radio
Date: 1990-05-18 04:28:00 UTC
From: UCSBPM@UWPLATT.EDU
Message-ID: <92AA2D589A9F201E5F@uwplatt.edu>
Source record: 11619

First, a little background:
I recently (hopefully) graduated*, and I was going to buy myself a
TS-440 with antenna tuner, but since I don't have a real job yet (hint hint)
I am probably going to buy a 2m/70cm HT.

* I participated in the ceremony, but I don't have that BSEE until the postman
visits with the diploma in hand [with my luck, it will be delivered to
Madagascar or Pitcairn Island :)]

The point:I already know quite a lot about the "big 3"'s offering for dual band
HT's, but I am curious about Alinco's DJ-500T (I think). Does anyone here have
one? Know where I can find a review? Any opinions? [It's significantly cheaper
and has a 2yr warrantee]. How about any other dual band HT's out there? I am
staying here in rural Wisconsin, nearest repeater 25 miles away {if you don't
count our schools that isn't yet up}. 2m is certainly not crowded, and 70cm (I
believe) is practically non-existent. However, there is enough 70cm stuff on
the trip home to warrant a dual band HT (IMHO). Besides, I'll be living
somewhere else in August.

Please E-mail, unless you think your comments deserve a post. I'll post a
summary if there is significant replies.

To the person who set up the mail-access callbook: A giga-blessing on you and
your kin! Some of us don't have telnet, and you saved our club $$ (since we
don't need a callbook now). Suggestions: Updated list, DX calls, and search by
name (ya, I know, all hard to implement but one can dream)

Oh, as part of my graduation present, I got the CQ antenna manual, and I opened
it up to see an arcticle by "our very own" Patty Winter (N6BIS).It's always neat
to see an arcticle by a name you recognize.

Thanks for any input about the radio

Hey, is this the same company that made the wonderful AOR 2001 and AOR 2002 scanners??
I was very charmed by these two scanners, they only lacked a lot of memory channels, but it looks like AOR has learned. Very interesting! If this is the same company, I'd like to know more, maybe Michael (see below) is willing to post some first impressions...

In article <1990May16.202509.2429@ncsuvx.ncsu.edu> garvin@ccvr1.ncsu.edu (Michael A. Garvin) writes:

| FYI, I ordered one today from Grove. They have them for $459, and they
| are in stock and shipping.
Ah, an experienced user by now, I think ;-)
I'd love to hear your opinions on it. I'm pretty much interested in how it performs in the following frequency ranges:

68-88 VHF low, NFM
108-136 Air band, AM
200-400 Military Air Band, AM
440-512 UHF, NFM

Of course, there's a big difference in for what services frequencies are used in the USA and over here in the Netherlands, but maybe you can tell something about it anyway.

thanks for your time,

2916. Re: Looking for 2m HT purchase advice.

Newsgroup: rec.ham-radio
Date: 1990-05-18 15:25:44 UTC
From: bobw@col.hp.com
Message-ID: <24300006@col.hp.com>
Source record: 11527

As a newcomer to ham radio, I am looking for some advice on purchasing
my first rig, a 2m HT. I want to start with a couple-year-old used one

---
A few more opinions:

* By now you have noted that folks are pretty opiniated on the merits
of various rigs. The ideal feature set/user interface varies a great
deal with the speaker. The technical issues are a bit more concrete.
If someone has actually tested a radio and found it lousy then its
probably lousy and overrides thousands of comments of "I've never had a
problem.")

* I would suggest that EVERY radio mfg has introduced a dog a one time
or other. But generally ICOM, KENWOOD & YAESU have all built some
fine radios.

* Power output: most folks I know leave their HT's on low power due to
battery life considerations. Most repeaters in Colo do just fine
with fairly low power. The exception might be the "HT in the car"
mode. First action there is an external antenna. Along these same
lines I vote for multiple small battery packs rather than one big
one. Keeps the HT size down and allows you to recharge one pack
while using the other.

* Memories: try to get an HT that remembers the offset in memory.
Some of the older ones (Yaesu FT208R, for example) require you
to muck with the offset control every time you switch memories.

* The IC2AT is a fine radio, but doesn't have memories.

>potential disasters in mind...

Certainly I have taken precautions so that non-hams will *not* have access
to this system. There is a logon procedure which will only allow users which
have been registered to use the system. People without ID's and PW's are not
told anything, they are just hung up on. Basically, it's a closed system. Only
the people who I've given access to manually can get on.

My real concern is whether or not it this considered legal operation of my
station. If my friend dials in, logs on, changes mycall, and uses my station
under his call, is it the same as him coming over to my place, sitting down
at my computer, changing mycall and making a contact? I believe that through
my interpretation of the rules, this is legitimate. What do you think?

NBS transmits 5, 10, and 15 (or is it 10, 15, 20 ?) Mhz signals which
are reputed to be THE time standard. Broadcasts are from Boulder, CO,
(WWVB), Hawaii (WWVH), and Idunno, (WWVL). They have an amplitude-
modulated tone (1Khz I think) and maybe some other stuff. Heathkit
(I'm not advertising for them) sells a "most accurate clock" kit which
will spit-out the time on a serial port for your computer's enjoyment.

Why make one? There is a DTMF decoder chip, SSI202, that does it all for you. All this in a 18 pin package. You supply the audio in and it produces a BCD output on 4 pins plus some other control lines.

There is a construction article in one of the old QST mags I have that has most of what you want. I don't have the month/year of the issue but can look for it if you are interested.

The circuit is a simple DTMF actuated controller. You can turn on LEDs, relays and just about anything else you want. It uses flip-flops to store the incoming DTMF digits. Once the proper sequence has been passed it will activate the corresponding device.

In article <1250157@hpnmdla.HP.COM> alanb@hpnmdla.HP.COM (Alan Bloom) pokes
a little fun at some of the strange CW call signs he has encountered:
>
>I suppose that a morse code fan would have liked being assigned my call:
>WA2ISE all dits in the suffix! .. ... .
>
>My favorite is the (at one time) very active contest station WB5EEE
>(known in some circles as "WB5S"). After the first dash in the "B", it's
>all dits: .__ _... ....
>
>There used to be an operator at W1AW with the call WA9HHH. On CW, this
>sounds like the error signal. ....
>
I can go you one better. I got baffled one night in a pile-up trying to
track the DX station's listening frequency (he was operating split). Finally
I found out why: there was a station hard at it in there with the call AA5NN!
A few weeks later I met the proud owner of this call and discovered it was
a very pleasant and friendly YL, Linda. Well, as we got to chatting, Linda
told me she was a CW-only op, and had moved up to extra largely in the hopes
of getting a decent CW call. You see, her general call had been N5DWN, and
every time she answered somebody they would QSY down 5. I guess this shows
that the FCC, just like lightening, DOES strike twice in the same place.

I may stick my foot in my mouth here, but John Cincotta said he needed
accuracy better than 300 microseconds. That means (assuming
everything else is ideal) that you need to know the signal path length
to within 90 kilometers. That may be a problem on frequencies where
propagation may be by skip. Here is the part where I guess that a
VLF signal is guaranteed to be arriving by ground wave so you just need
to know the distance to the transmitter.

2923. Re: Automated observatory, was Re: 60Khz time standard.

Newsgroup: rec.ham-radio
Date: 1990-05-18 18:03:49 UTC
From: myers@hpfcdj.HP.COM
Message-ID: <18230020@hpfcdj.HP.COM>
Source record: 11533

The 60 kHz time transmissions are WWVB, which is believe is very similar in format to the transmissions from WWV or WWVH on 2.5, 5, 10, 15, and 25 MHz. All are run by the NIST (formerly NBS); WWV's transmitters are right here in good ol' Ft. Fun, Colorado (if I stand up and look north right now, I can just make out the antenna farm!). WWVH is near Kehaka, Dauai, Hawaii.

These stations supply VERY accurate time and frequency information; not only is the carrier on-frequency to within an inch of its life, but the various beeps, clicks, and other tones used in the transmissions are similarly accurate. (For example, the tone at the top of the minute is EXACTLY(tm) 1kHz.) The time is also encoded in a BCD format on a 100 Hz subcarrier.

My 1981 copy of the ARRL _Radio_Amateur's_Handbook_ has a one-page diagram outlining the format, and I suppose that you could find this information in later editions as well. Or, simply write to:

Radio Station WWV
2000 E. County Rd. 58
Ft. Collins, CO 80524

Another station which provides a similar service is CHU, operated by the Canadian government on 3330 kHz, 7335 kHz, and 14670 kHz. They also provided encoded time information (although theirs is in a different format). Unfortunately, I do not have an address for CHU information.

There used to be a Heathkit clock which used WWV's time codes to keep itself correctly set, and I believe an RS-232 interface (or some such) was available as an option; I don't know if they still make this or not, but it or similar commercially-available products might be just the thing for unattended operation.

The wide-band radio shack scanners use a UHF local oscillator (~750-... MHz),
and ~610 MHz first IF. Since this 610 is also the first IF in standard
cable TV converters, this is probably not a coincidence. Thus, if you
try to receive in this frequency range, you run into problems - both LO
frequency stretch, and feedback between front end and IF.

I want to purchase a 2m mobile rig that will serve as a rig for the car (my home away from home) and a radio to support packet. The rigs that I am considering are the Kenwood TR751A, Yaesu FT290R, and a used Icom 255A. I will appreciate any feedback I can get concerning these rigs, or any others that any of you might think worthy of consideration, but are not on my list. I would prefer the "all mode" feature, but it isn't a necessity. I will gladly summarize my results, and repost in a few days. Thanks in advance for any and all assistance!

In the last radio telescope I worked on in Japan (34 Meter dish in Kashima, completed late last year) they used a hydrogen maser to provide a 10 MHz reference for things like downconverters. Unfortunately, they had only one located about 700 Meters away from our dish, and ran it out on some cheapo coax (RG-58, I think) that was quite prone to the 50 Hz power line frequency used locally. REALLY screwed up the maser purity. The local oscillators wouldn't lock because the PLO's weren't getting a stale frequency. They also used the dial up 'phone time' to set all their clocks for pointing the telescopes. Seemed kind of wierd, after dropping $10M on the telescope, but I guess it works for them.

Just thought you might get a chuckle from this info.

Compiled by K4ON from May, 1990 QST

Last year I went out to Fort Lewis, Washington (near Tacoma) to operate the Army MARS station there. Quite impressive! For some reason, I pictured a small station with old gear tucked into the back of a Quonset hut somewhere. What I found was a LARGE antenna farm that definately looked like a high-powered HF military station. There was a nice building with a separate room for each operating position. I got to operate some very nice Harris mil-spec high powered HF radios into some huge log-periodics and wire arrays. It was fun working cross-band on all those weird frequencies.

26389 BF 1878 1 0508/1111 6894_TI3DJT TI3DJT MODS@NYNET ()
Sb: speeding up Uniden 2510 AGC

For those of you who are using a Uniden 2510 for packet, you can speed up AGC speed considerably, just by removing the AGC SSB switch transistor Q-111 This transistor switches the AGC off for CW operation, and on for SSB operation. All I did was remove it and my radio now works with very good speed on 10m. You may put a switch between the pads that were for collector and ground. When you want slow AGC turn the switch ON pulling line to ground. For fast agc turn switch off leaving line floating. That is all there is to it.

The description of the mod for the 2510 may work for the 2600. Those who have the Uniden 2600 may find that the AGC is the same for this radio. Look for NJM2902 IC (this is the AGC amp), you may find a transistor connected thru a RC network, to pin 12 of said ic. Remove also. (this mod not tested!)

Ciao de Chuck ti3djt @ ti0paq.cri.na

Note: I haven't tried or verified this, proceed at your own risk! WA2ISE

Why do you need such an accuracy? With a clock that is only 0.001s accurate, you can achieve a pointing accuracy of 0.015 arcsec.s, which is much less than the errors introduced by telescope flexure and atmospheric conditions. At McDonald Observatory we automated our 36" telescope with a clock that has about the same accuracy as the Heathkit 'most accurate clock'. The system puts the object on the cross-hairs every time. We are currently looking to port this system onto our 107", 82" and 30" scopes also.

A clock with only millisecond time accuracy can also serve as the time standard for your insturments. VERY rarely do you ever need a more accurate time than a millisecond in astronomical data collection.

PRODUCT REVIEW: ICOM IC-228H 2M TRANSCEIVER

by Bob Parnass, AJ9S

My Icom IC28A performed very well, and giving it to my wife
afforded me the opportunity to buy another 2 meter radio.

What do I look for in a 2 meter transceiver? Being a
scanner enthusiast, I look for wide frequency coverage on
receive, and reasonable scanning facilities. Reliability
and ease of obtaining schematics and parts are important,
and Icom, Kenwood, and Yaesu score well here.

I prefer 25 watt radios to 45 watt radios for a few reasons:

1. I believe manufacturers overrate their transmitters'
power specifications. Most models use hybrid modules
for the driver/final amplifier stage. As a recent QEX
article points out, the hybrid modules are only 25% -
50% efficient, which means the bulk of the power is
dissipated in the form of heat.1

The heat sinks on today's radios are just not big
enough to dissipate the kind of heat developed during
my typical QSO (conversation). The heat sink on my
old 25 watt Motorola MetrumTM never got nearly as hot
at the heat sinks on late model 25 watt Japanese
radios. My 25 watt Kenwood TR-7800 and IC28A became
very hot during QSOs. Pity those who bought Kenwood's
"45 watt" TM-221A transceiver. It's not until they
read the owner's manual that they learned Kenwood
recommends against transmitting for more than 1 minute
out of 3.

Heat shortens the already finite life of the hybrid
modules, and I've been forced to replace these modules
on various radios, to the tune of over $55 apiece (not
including my labor).

2. It's easier to find power supplies for 25 watt radios,
because they require only 6 - 7 amperes, versus 9 - 10

amperes for their 45 watt counterparts. The smaller power supplies are less expensive and are easier to find surplus.

3. Signals from 25 watt transmitters are almost as strong as those from 45 watt radios.

The IC228A/H series is Icom's replacement for the IC28A/H two meter radios. The tradition of offering two models at different transmitter power levels continues, with the 25 watt IC228A and 45 watt IC228H.

The IC228 contains a single VFO, and 20 memory channels. All the memory channels behave the same, as contrasted with some Kenwood designs which limit the flexibility of certain memory channels, while permitting special operations with others. Each IC228 memory channel can store receive frequency, CTCSS tone, transmit frequency offset, and scan list lockout.

Unlike Yaesu radios, the IC228 comes equipped with a synthesized CTCSS (PLTM) tone encoder, which is almost a necessity for using repeaters in the Chicagoland area. Any one of 32 tone frequencies can be selected from the front panel, and associated with a memory channel or VFO.

Repeater offsets are selectable from 5 KHz through 10 MHz, and can be stored in memory. You could conceivably store 20 different repeater frequencies in the IC228, each with a different offset and tone.

I wanted the 25 watt IC228A, but only IC228H models were available at the time. I'm glad I bought the IC228H high power model, because an internal potentiometer made it easy to reduce power output from 45 watts down to 25 watts. The large heat sink affords extra cooling capacity, and the final amplifier should last longer. Even so, the heat sink becomes too hot to hold during a moderately long QSO! Heat is eventually transferred from the heat sink to the entire radio case, making the entire radio "untouchable."

The major changes in IC228 circuitry from the IC28 design involve the microprocessor. The RF circuits remain similar, using the same transistor lineup in the transmitter stages and the now familiar Motorola MC3357 IF detector/squelch chip popular in scanners.

Icom took cues from the Kenwood TM2530 series to improve the LCD display panel and make the front panel controls visible in the dark. The display on the IC228 makes use of colored backgrounds for various fields, and is easier to read than the display in the IC28.

Unlike the IC28, the IC228 emits a beep tone each time a key is depressed. Although some people find this feature annoying in walkie-talkies, the beeps make it more convenient to operate the IC228 while driving. Icom recognizes freedom of choice, and permits the user to disable the beep.

The volume, squelch, and tuning knobs, as well as several buttons, are now backlit - an improvement over the IC28. The IC28 contained a photocell which automatically varied the LCD backlighting with changing ambient light levels, however the newer IC228 permits the user to select from 4 fixed levels of backlighting.

There is no free lunch, and Icom fans had to give up something in exchange for the new control backlighting: the plastic front panel and tuning knob on IC228 feel chintzier than the metal panel and rubber padded knob on the IC28.

Another new feature is a "lock" pushbutton, which disables the radio's front panel controls. I haven't found this as useful as the lock slide switch on the DTMF up/down microphone. The up/down pushbuttons on the microphone can be bumped accidentally in the mobile environment, and the slide switch prevents unplanned frequency changes.

The IC228's scanning features are on par with, or slightly above those of other 2 meter transceivers, but not as well implemented as in "real" scanners. The IC228 scans at the same speed as the 28 - rather slowly. A reasonable memory scan, with channel lockout, is provided. This is an improvement over the early Kenwood TH-215 walkie-talkie memory scan, which lacked a lockout feature, so one was forced to scan ALL channels.2

The timer operated scanning in the IC228 causes the radio to resume scanning 2 seconds after the carrier drops, or after 15 seconds - whichever occurs first. Too bad the IC228 lacks a carrier operated mode, like the feature in the Kenwood TM2530, so the receiver would "stay put" until the carrier drops.

The IC228 includes the ability to search between 2 frequency limits, and users of the American versions can select tuning steps of 5 KHz or more. The search limits are programmed into a special register pair, so they don't tie up memory channels. The search will pause as soon as the squelch opens, which usually brings the receiver to a halt off the center of the station you want to hear. Unfortunately, Icom didn't adopt the Kenwood "center tuning" or Bearcat ZeromaticTM feature, which forces the searching to stop right on the center frequency. The Bearcat window detector circuit employs operational amplifiers, fed by the discriminator signal, to generate a logic level when the receiver is

tuned within 2.5 KHz of center frequency.

When the IC28 was first introduced, it was offered with either the standard or DTMF microphones, at two different prices. Apparently, most people wanted DTMF mikes, and a DTMF microphone is provided with the IC228.

Except for the high heat sink temperatures, the IC228 performed well during a recent cross country trip. With the radio bolted to the center console of my truck, the receiver audio output was ample, the display easy to read day and night, and stations in Pennsylvania and Ohio praised the transmitted audio quality.

I'm pleased with the IC228, and recommend it.

---

1. See "RF Hybrid Modules: Building with Bricks," by Bill Olson W3HQR, in July 1988 QEX.

2. Late vintage Kenwood TH-215 walkie-talkies now come with upgraded firmware which permits channel lockout. A new CPU chip may be retrofitted into earlier units, but Kenwood charges for this service.

Dongle, now there's an interesting term. Banyan uses them on their servers and just called them 'keys'.

I can't speak for the ones need on the Amiga but I would imagine the ones used by Banyan were a little more complex than just jumpers because they hook up to the printer port (paralel) and don't interfere with the normal operation of the printer. I had always assumed they had enough smarts to return an answer when queried about their status. Then all the software has to do is read/write the printer port.

Anybody got more info?? Anybody from Banyan out there??

Inquiring minds want to know!!!

> will spit-out the time on a serial port for your computer's enjoyment.

Some of the above reply is not quite correct. The NBS (now NIST)
transmits HF time signals on 2.5, 5, 10, 15 and 20 MHz from Ft. Collins,
CO (WWV) and Kauai, HI (WWVH, omits 20 MHz). They also do indeed transmit
a time signal on 60 kHZ (WWVB, in Ft. Collins, CO). WWVL was a 20 kHz
station at the Ft. Collins site but was shut down 20 years ago. In
addition to this, NIST transmits a time code on the interrogation
channel of the GOES satellites, this at slightly above 468 MHz. All
this is from NBS Special Publication 432.

While the WWV(H) time signals are certainly very accurate as transmitted,
HF signals propagate by F-layer skip which means the transmission path
length will vary somewhat unpredictably from day to night, summer to
winter, and with changes in solar activity. The time you receive will
thus jitter by something on the order of several milliseconds. Also,
since HF propagation is fairly unreliable, you will need a reasonably
stable oscillator backing the receiver for periods when the time signal
is unreceivable.

Heathkit does make a clock to receive the WWV(H) time code (which is
modulated on a 100 Hz subcarrier, you can hear it if you turn up the
bass on your radio), and it is cheap, but it is also incredibly poorly
done. The time code from the serial port only gives you the time to one
decimal place after the seconds (i.e. 100 ms), you have to guess at the
rest. Worse, if the receiver loses the time signal (which it will, this
is HF radio) the time will sail off into never-never land with no
indication that all is not well. A well-done WWV(H) receiver with an
RS-232 interface is sold by

Traconex Inc.
1140 N. Kraemer Blvd, Ste. G
Anaheim, CA 92806

but this is probably not a big volume item and is quite pricey (I think $1200 or so). This will provide time to within a few milliseconds of UTC under most conditions.

Because low frequency radio is less affected by ionospheric variation (it propagates using the earth's surface and the ionospheric D-layer as a wave guide), WWVB will in principle give you accuracy better than 500 us, and perhaps as good as 100 us. There are a number of companies which sell WWVB receivers, including

Spectracom Corp.
101 Despatch Dr.
East Rochester, NY 14445

Kinemetrics/Truetime
3243 Santa Rosa Ave.
Santa Rosa, CA 95407

but if you don't like the price of the Traconex receiver you aren't going to like these at all. Note also that if you really need 300 us time at all times you would probably want to back these radios with a good quality ovenized crystal oscillator to cover periods of signal dropout (though this is less of a problem at 60 kHz than at high frequencies), so add another $800. Kinemetrics (among others) also makes a GOES receiver for even better accuracy and reliability, but at correspondingly higher prices.

If these are outside your budget but you don't mind doing some soldering and you are located close to the east coast you might look at the CHU time signal instead, at 3330, 7335 and 14670 kHz. You can build a quite decent receiver for the timecode with a consumer HF radio and a well-filtered 300 bps modem (the latter you might have to construct). Carefully done, this can give you the precision of the Traconex receiver during periods when the signal is recievable, though to match the reliability of the Traconex you'd need a radio receiver which allows computer control of the frequency (this puts the price up) and this will still only give you several-millisecond precision. Homebrewing a WWVB receiver from scratch would actually be a fair bit easier and cheaper than WWV/CHU if you are into LF radio receiver design, but would still be in the category of major project.

I think the upshot is that there is currently no cheap way to buy a time code receiver which is accurate to 300 us, and no easy way to build one. Milliseconds are cheaper/easier to come by, but still pricey. The Heathkit radio is cheap but I wouldn't trust it for more than setting my watch and even then I'd want a second opinion.

If you've got a few years to wait, however, I'd watch the price of GPS receivers. Even the degraded version of GPS that non-military people get to use should be able to provide microsecond timing (it

has to to provide the positional precision it does), and now that there actually exist some GPS satellites I wouldn't be surprised to see the price of these receivers eventually fall to not much more than that of a good quality scanner as volumes increase. This is definitely a future item, though, as the price of current GPS receivers is absolutely frightening.

At 60 khz, the WWVB carrier cycles every 16.67 usec. The best resolution you can get would be at least 1/4 of that and possibly even better. The hitch is knowing the propogation path delay between you and the WWVB transmitter site. While the distance can be calculated very accurately, I'm not so sure there are no propogation effects that need to be accounted for. But the WWVB signal does not have the regularly changing effects you would see at HF frequencies. Also, 60 khz is easier to digitize and do some slick stuff with than 5 Mhz.

The carrier is dropped in power by 10 db at the beginning of every second, and stays down for 200, 500 or 800 ms depending on whether the bit is a 0, a 1 or a marker, respectively. A marker is sent every tenth second, with a pair of them at seconds 59 and 0 of the minute. The other bits encode the time, date and some other junk, in BCD.

A receiver which does a good job of decoding this can be a fairly simple thing. Phase lock to the 60 kHz carrier and use the output of the PLL as a detector for the amplitude changes. This gives you both the time code and a nice, accurate frequency source.

Since I started this thread, let me ask another question about packet systems.

As I understand it, the packet network exists because when a packet is broadcast, any other node which receives that packet and finds that it is not addressed to them, rebroadcasts that packet. (Digipeater?)

If this is so, than it seems to me that unless the operator of each repeater is verifying each packet sent out over his transmitter, than he is in essence doing just what some people were commenting on: the ability to resend mail addressed to a packet site which originates on a land-line based network (ie. uucp or internet).

By the way, aren't there restrictions on the types of things which can be posted on some machines in the internet? Like advertisements?

Actually, NIST transmits as follows:

WWV (Fort Collins, CO) 5000, 10000, 15000 (*)
WWVH (Kaui, HI) 5000, 10000, 15000 (*)
WWVB (Fort Collins, CO) 60

Frequencies are in KHz. The entries flagged with a (*) may also transmit on
any or all of 2500 and 20000 KHz - it's been a while since I checked :-)
NIST used to operate a station on 20 KHz (WWVL). It was shut down a number
of years ago. You can also get the time broadcasts over the phone. No, I
don't have the number.

There is quite a bit of "other stuff" encoded in the transmissions. A call
to NIST will scare up various bits of documentation on the formats used.

There are quite a few LF time stations in operation. Following is a repeat
of a posting documenting some of them.

To: IN%"infohams@taunivm"
CC: ARYEH
Subj: 100 GHz and up

What is currently being done 100 GHz and up? Is there commercial communications
gear in that range, and if so, does any show up on the surplus market?
Does anyone on the net have experience in that area?

I posted this once before, but had some mail trouble and missed info-hams
for a while. Please email, and I will summarize to the net.

1. GPS satellites have been up since 1978. The Block I's were and
are o.k. for time transfer; actually they are better than the Block II's
since Selective Availability is not currently implemented on the
Block I's.

2. You can get a basic GPS receiver now for $3,000 (U.S.) and several
companies have announced receivers for delivery this year with even
lower prices. Perhaps not at hobby prices yet (but well within the
gra$p of a well-healed yachtsman) but the time will come (within 5
years, probably) when you'll be able to get one for about $500.

2955. RTTY firmware help, please?

Newsgroup: rec.ham-radio
Date: 1990-05-20 13:25:23 UTC
From: lkay@ecs.umass.edu
Message-ID: <9870.26569ac4@ecs.umass.edu>
Source record: 11560

At a recent hamfest, I acquired for a *very* reasonable sum a simple RTTY setup consisting of AEA CP-100, an MFJ crosshair tuning aid, monitor, and (here's the laugh(?)) a Model 2 TRS Coco, complete with ROM software cartridge. It serves me just fine, *except* that the ROM cartridge is sorely lacking in features; I'd like to tinker with the system and do better.

My question for the net is: (1) Does anyone have or can tell me where to get an assembly/tech manual for the Coco 2 so I can write my own demod code and chuck the ROM? (2) Does anyone know of a *good* ROM cartridge that existed for the Coco 2 for RTTY? (I don't care if it doesn't have AMTOR) Or even a good piece of software?

Any answer is helpful. I just want to tinker and have maximum fun on RTTY for my small investment.

Tnx,
Len

2956. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-05-20 16:00:45 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9005210708.AA17238@ucbvax.Berkeley.EDU>
Source record: 11568

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

2957. Antena question

Newsgroup: rec.ham-radio
Date: 1990-05-20 16:34:57 UTC
From: gaddam@topaz.rutgers.edu
Message-ID: <May.20.12.34.51.1990.6067@topaz.rutgers.edu>
Source record: 11559

I would like to know is there any harm in connecting an external wire
antena (to be used with a SW radio) to a TV antena which is on the top
of our apartment complex. By doing so it improved the signal strength
to some extent but it sounds like either the circuitary is generating
static or the antena is overloading. However if I connect the same antena
to an adjacent(to TV antena) chimney, the overloading/static disappears.

* I am using SONY ICF 2010

As I understand it, you can't just apply for a reciprocal license while there. The only people I have heard of who were able to operate there buddied up with a member of the royal family and operated his station.

I would check with the ARRL at 203-666-1541.

2959. TNC's / Packet Pirates

Newsgroup: rec.ham-radio
Date: 1990-05-20 17:55:17 UTC
From: TCOMGRD1@OUACCVMB.BITNET
Message-ID: <9005210708.AA17246@ucbvax.Berkeley.EDU>
Source record: 11566

Date: 20 May 1990, 13:44:41 EDT
From: TCOMGRD1 at OUACCVMB
To: INFO-HAMS@WSMR-SIMTEL20.ARMY.MIL at MIL

Well now, if packet radio does actually just "repeat" messages whithout
checking authorization (if it is not destined for me send it on) would
it not be possible for some non-licensed pirate to upload files and
have them sent with no authorization??

Also.. I'm preparing to purchase a TNC myself, the computer I will
be using is an Apple][c. Are there any programs to interpret WEFAX and
such on the Apple? I know some exist for the Macintosh, and MANY more for
IBM's, but I'm looking for Apple][series.
Also (again), What baud rate (Whats the diff between baud and bps [bits per
second]?) should I get? I see ads that say "2400 baud with up to 1200bps".
I'm confused. I use a 2400baud modem on my Apple already, so dont want to
run packet slower than that unless it will cost an arm and a leg.
And last, but not least, Could my current modem be used for packet at all? I
know packet is a "burst" transmission with temporary carriers, and modems are
constant carriers.... but is it possible?? (trying to save $$)

Source record: 11569

Has anyone gotten a G3RUH 9600 baud modem working on any radio on 220 MHz?
If so, could you please specify what radio, and any other personal experience
that you may have had with these modems. I am especially interested in any
reports of problems using them with PLL radios.

I am aware that they are a "plug and play" with the new Kantronics DVR units,
but Kantronics doesn't make one for 220. In addition, the TAPR packet-RADIO
seems to be pretty well bogged down, and their beta test models are now
going to be strictly on 2 meters vice both 144, and 220 MHz.

Any "hints or kinks" would be MOST appreciated!

Thanks for your time.

A factor that must be considered when using accurate time sources for telescope pointing is the slightly irregular rotation rate of the earth due to seasonal movements of water and the atmosphere. (These movements cause small changes in the earth's moment of intertia. Since angular momentum must be conserved, the earth's rotation rate must change to compensate.)

UTC is based on atomic clocks that are much more stable than the earth's rotation, so much more so that UTC has to be adjusted occasionally to keep it within a second of "earth time". This is the reason for the "leap seconds" that you hear so much about at the end of most years. The difference between UTC and UT1 (or "earth time") is encoded in a series of double ticks at the beginning of each minute on both WWV and CHU. These codes only have a resolution of 100 ms, so even if you knew UTC precisely you could point your telescope to a given point on the celestial sphere to a peak-to-peak error of 1.5 arc-seconds along the right ascension axis. Given that this is about the resolution of the best ground-based telescopes, I wouldn't worry about this level of error.

Phil

2962. Re: Dongle's

>

I went to a few dictionaries to check for a kosher definition and
found nothing. It may be in the latest and greatest OED, but I don't
have that one.

The first official reference I recall for the term dongle was used in
reference to the Sinclair QL computer (What dat?).

By the time Sir Clive and chums had got all the circuitry together,
it no longer fit in the spiffy case. So they had a little box hanging
off the back with the extra parts in it. This was referred to in the
press as the "dongle board".

The QL and its dongle board have disappeared into computer history,
but apparently the term dongle lives on

I looked at the word "dong" to see if it was derived from that.
I assume not, dong means to hit or strike in Aussie slang, a small
aluminium coin in Vietnam and of course a penis as John Steinbeck
noted in the Grapes of Wrath. I would say that dongle is just an
amusing variation of dangle.

Maybe now the Apple people can work on a copywrited dongle icon (-:

right ascension axis.

If you want to synchronize your clocks to within 100ms or even 50ms, you
can dispense with a WWV(B) radio clock, and just get an internet connection.
You can easily synchronize your clocks to these accuracies using NTP (the
Network Time Protocol) across the Internet. Have the network connection
has other, obvious benefits as well...

See RFC-1129 for all of the gory details.

Yes, the AEA Isoloop is a real product. I saw one up close at Dayton,
and several hams in the Seattle area have been beta-testing them and
reporting great results. Personally, I prefer a larger antenna, but
it sure seems small and versatile, and the remote tuning makes it
flexible and fairly efficient. My friend KA7MCX bought one, and has
been working a lot of DX on 12 and 17 meters with it. I wish I could
get him to replace the radials on his Butternut vertical and do some
A/B testing just out of curiosity.

On the plane back from Dayton I ran into Mike Lamb, N7ML, AEA president.
He showed me a log sheet of all the DX he has been working on his.
Quite impressive. Of course you could work the same stuff with a
dipole, but I think they have a hot product here. It does seem a little
expensive to me though.

Yes, you can keep taking tests until you have passed them all. It has even been done in one sitting. My friend JA5GLY came to visit me in 1981, when they were still testing hams at the FCC. He went to the FCC office in Seattle and in one sitting passed all of the exams, Novice through Extra.

If you pass the Novice test, it makes sense to sit for the Tech exam too, even if you have not studied for it. You never know...you might get lucky!

My pal John and I have been hamming together for years. Back when he
was N7COV and I was WA7CSK, we used to enter contests together at
each other's stations.

This all changed, at least on CW, when we got new calls.

Now he is NT7S, and I am KT7H. Imagine being either one of us, and
going to the other guy's station to operate a CW contest.

My call:

-.- - --... ....

His call:

-. - --... ...

Mine has one more dah on the front and one more dit on the end. We have
real problems getting used to sending the other guy's call on CW!

I doubt it. It's still largely undeveloped, and (totally)
under-utilized.

Since 24, 47, and 76 GHz have all been done already, the next band to tackle (in the USA) would be 120 GHz. (At least I think that's where it is; I don't have any reference materials handy.) I was working on 76 GHz before I quit my job and came back to school, but I don't have any time for it anymore.

A time standard for an automatic observatory must deal with radio propagation delays AND changes in the official definition of time itself (i.e. leap seconds). This unfortunately is not a joke...

I winter-overed at the Amundsen-Scott South Pole station during the 1982-83 season as a support scientist for various U.S. National Science Foudation research projects. My partner and I had to keep all the clocks of the instruments in the Skylab building accurate to within 10 ms. We would manually set the time standard by monitoring the time signal with an oscilloscope on the back end of our radio receiver.

The South Pole station was effectively cut off from the rest of humanity for about six weeks during the depths of the austral winter (June-July) when we could not receive any radio signals at all. After we rejoined the world and could once again receive radio signals, my partner and I decided

to check the clock... We were shocked to find that all our clocks were precisely off by 1.000 +- 5 ms from UT! A leap second had occured and we had not been warned. Sigh...

So the upshot is that the definition of time itself can change and a truely automatic observatory must take this into account. A SEMI-automatic observatory would, of course, not have to worry about leap seconds.

Yours in the pursuit of accuracy and precision,

]
True, but I don't do much mobile work. I can re-program all of the
R7000's 99 memories from the computer, so when I want to run
computer-less, at least I can set it up easier. I think that
"relational" databases and the like on a mobile unit is a bit
much, I don't want all that stuff while I'm trying to drive :-)
However, the nice scan-delay features would be useful anywhere.

If you're talking portable, it's no problem to run from a laptop.
He** many laptops are no bigger than an R7000!

>Can you have it stay on the frequency as long as there is a signal for
>up to 30 seconds, and have it stay after the signal is lost for up to
>2 seconds? Does the computer get to control things at this level? Does
>it get to know when a signal is present and gone instantly?

Yes on all counts. Set either timer to anything with about 10th
second resolution. The R7000 makes signal-detection easy, the
recorder-control relay is lightning fast, you do lose that function
for recorder-control though. This is no problem for me, I use a VOX
recorder for that.

Again, the computer has some drawbacks, but I still claim it will
be a long time before manufacturers obviate the need. My program uses tons
of memory, just the channels data takes 64K. Because when you start
having hundreds of channels, you really need a text description to
keep track of it all. Also, you'd like to be able to deal with
your frequency lists with a text editor, import them from BBS files,
print them, etc. That's going to take quite a bit of hardware and
software to build into a scanner.

I've noticed lately a couple of products that will let you "download"
your PRO 2004 from a computer, i.e. set the channels up. It's slow
so this type of control isn't good enough for scanning, but its
a start.

Re format of WWVB transmission: you can find it in a lot of detail in "Reference data for radio engineers" which a good library would have. I would assume that a letter to WWVB asking for information would also work.

As for phase locking to the carrier, be aware of the WWVB ident! The way it identifies (if memory serves) is that the carrier phase shifts by 45 degrees at n:05 and back at n:10 every hour. If you weren't expecting that, you might see some strange effects...

Does anyone happen to have schematics to do such a thing? The only one I've ever seen was a pre-fab and too expensive. I think it was a Heathkit. It had a built-in clock for when it lost RF, so it would still be able to keep time.

Thanks,

Many of the older synthesizers required a little readjustment of the PLL voltage control once the frequency was "opened up". This control is most likely a inductor or capacitor located in the (typically) shielded PLL module. The adjustment hole may be covered with a small sticker. I'll try to Email the details to you if I have them. Also, I remember an article (actually several) in 73 Magazine on the mods to this radio. In particular, there was one written about early 80s by Robert Morrow in 73.

Basically, you slowly tweak this control until the radio unlocks just below the lower desired frequency limit. Then you end up with the upper edge as high as it will go; for the IC-02A, typically 163 MHz.

One of my favorites is the shortest CW call in the US, N5EE, whom I've
worked in contests (no, he doesn't send RST 555), although since the call
sign restructuring, this call is of course matched by NE5E.

I once operated Nov. SS from a club station using another member's call,
KR2B. THAT was tough....

2978. radar detector front end overload?

Newsgroup: rec.ham-radio
Date: 1990-05-21 17:21:12 UTC
From: lrj@ishtar.cs.cornell.edu
Message-ID: <41226@cornell.UUCP>
Source record: 11480

Okay, here's one that I've started noticing recently. In my
car I have a radar detector (Whistler 425) on the visor, and
I usually also have my 2m HT (IC-2GAT). When I key up the HT,
the radar detector will frequently start falsing. This happens
occasionally when the HT is using the rubber ducky & 1 watt output.
It's more regular when running high power (7W) with either the
ducky or the 1/4 wave mag-mount on the roof.

Yesterday I installed a RF Concepts 2-23 power amp, and the
>30W output to the magmount will regularly set off the detector,
reading about a half-scale alert.

Has anyone else run into this problem? If this is front-end
overload on the part of the radar detector, is there anything
that could be done? Obviously, putting the detector into a
Faraday cage is not an acceptable solution... :) Another note
is that this *does* happen when the HT is running off of
battery and is not connected to the amp.

Any and all ideas regarding this problem would be
appreciated.

Yep, you sure can. In fact, I did just that. Since I didn't have _any_
license at all when I walked into the test, I had to wait for the FCC to
be able to transmit. (There is no "temporary KN for novices!) If you
already have a license, you'll get a temporary authorization to use your
new privs.

>And what how are these bits encoded? I means thinks like which seconds
>of the minute cooresponds to which data item, etc? And what is this
>"other junk"? Anything useful?

I'll bite, since I once typed this in for another reason and still
have a copy. For your edification the WWV(H) time code is included
as well. You can actually decode the latter by ear if your
short wave receiver's audio section will give you enough
bass to hear the 100 Hz.

WWVB drops carrier power 10 db at the beginning of every second,
and stays down for 200 ms for a 0 bit, 500 ms for a 1 bit and
800 ms for a marker. WWV(H) transmits a 100 Hz subcarrier which
begins 30 ms after the on-time second (except for second 0, where
the pulse is omitted) and remains on for 170 ms for a 0 bit, 470 ms
for a 1 bit and 770 ms for a marker. (m)'s in the table indicate
markers, while unused bits are transmitted as 0.

Note that this all comes from my copy of NBS special publication
432, which is old. WWVB has recently been upgraded to include, in
addition to this, the year-of-century and a leap second warning bit in
the unused bits at the end of the minute, but I've misplaced the note
concerning where the new bits are actually located (I think the
year is sent during seconds 45-48 and 50-53). WWV and WWVH were
also to be modified to include this information but the company building
the new time code generators went out of business. They are still tendering
for bidders to do this, if anyone is interested.

The WWVB format is essentially IRIG-H, which is a standard time code
format for laboratory use. The WWV format is unique.

2981. Motorola Radius VHF HTs

Newsgroup: rec.ham-radio
Date: 1990-05-21 18:11:28 UTC
From: wlw2286@ultb.isc.rit.edu
Message-ID: <3195@ultb.isc.rit.edu>
Source record: 11483

Two questions on Motorola HTs.

What is list price for the VHF HTs with Antenna, Belt Clip, AC Adapter,
NICAD, & Charger.

What is a good selling price for these?

And (woops) a third question, what is the Green-Dot Freq?

Thanks,
Lance Ware

2982. Re: Dongles!!

Newsgroup: rec.ham-radio
Date: 1990-05-21 18:47:11 UTC
From: jpd@pc.usl.edu
Message-ID: <8765@rouge.usl.edu>
Source record: 11482

The Rode-PC data entry package requires these gadgets. It's one step
better than copy protection, but I did have one fail and had to return it
for replacement (it was free, but the package was dead until I got the new one.

I suspect that there is a state machine in the dongle, that looks at sequences
of bytes sent, until it is satisfied, then returns a pattern on the parallel
port status input lines. Since the printer still works, the Rode package
must be sending bytes out WITHOUT the data strobe (I assume this is possible,
but haven't a programming reference nearby). Perhaps one data bit is
used as a strobe. Someone with a data analyzer could probably figure out
the sequence.

HELP.... We have a two meter (146 MHz) Amateur Radio repeater to repair. The manufacturer wants full commercial prices, and will only sell us the "whole module" at full commercial prices instead of selling us just the parts we need to repair the Power Amplifier.

We need to repair our Aerotron 60BT100R transmitter. The finals in this 100 Watt unit have destroyed themselves, and in the process destroyed the printed circuit board.

Since the commercial world is expensive (almost $500.00 to replace the whole module), and they will NOT consider selling us the parts to repair our Power Amplifier module, I am looking to the NET to help our repeater group out (Yes, this is to support an OPEN repeater).

The final transistors are made by CTC and are part number BM70-12, we need TWO (2) of these. I am told that these are no longer in production, and are very hard to locate.

If you have, or know anyone who has connections that might be able to help us, please contact me!!

We are looking for any or all of the following:

(quantity 2) CTC BM70-12 power transistors.

Circuit board for the Aerotron 60BT100 Power Amplifier strip.

Used (or new) 60BT100 Power Amp strip (we will consider a lower power strip also), this is the 146MHz unit (VHF range A??).

2984. Question About Military RTTY Practices

Newsgroup: rec.ham-radio
Date: 1990-05-21 19:45:00 UTC
From: nix%muppet.decnet@CONSRT.ROK.COM
Message-ID: <9005220703.AA07559@ucbvax.Berkeley.EDU>
Source record: 11508

I was trying to work NPG, Saturday afternoon on 20 Meter RTTY, during Armed Forces Day. Although he heard me once, we didn't manage to have a proper `exchange'.

A question came to mind. With NPG transmitting (just below the bottom end of 20 Meters) `upside down' (ie. his mark-space frequencies were inverted, as compared to amateur radio practice), was he listening `inverted' also?

My second question is, when a military station announces "listening on 14.080 MHz", does he expect to find our mark (or space) carrier on that frequency or, should we `straddle' it? I believe that its been an accepted practice, among hams, to refer to the `mark' frequency, when it's necessary to specify frequency. What are the accepted military/commercial standards? Is this sort of thing specified in some CCIR publication?

Any thoughts on this subject would be appreciated.

Please reply to (InterNet) "nix%muppet.decnet@consrt.rok.com".

Thanks,

Paul Nix WB5AGF

2985. The GAP Antennas

I was unable to respond directly to the person interested in this antenna.

Therefore: Check out the March 1990 issue of CQ magazine, pp. 32-33 for
and article by Lew McCoy W1ICP.

Lew seems impressed by the antenna, and comments that the DX-VI works out
very nicely from 80 through 2 meters! Yes, it works well on 6 and 2 meters
as a bonus.

Check it out.

| > will spit-out the time on a serial port for your computer's enjoyment.
|
| Some of the above reply is not quite correct. The NBS (now NIST)
| transmits HF time signals on 2.5, 5, 10, 15 and 20 MHz from Ft. Collins,
| CO (WWV) and Kauai, HI (WWVH, omits 20 MHz). They also do indeed transmit
| a time signal on 60 kHZ (WWVB, in Ft. Collins, CO). WWVL was a 20 kHz
| station at the Ft. Collins site but was shut down 20 years ago. In
| addition to this, NIST transmits a time code on the interrogation
| channel of the GOES satellites, this at slightly above 468 MHz. All
| this is from NBS Special Publication 432.
|
| While the WWV(H) time signals are certainly very accurate as transmitted,
| HF signals propagate by F-layer skip which means the transmission path
| length will vary somewhat unpredictably from day to night, summer to
| winter, and with changes in solar activity. The time you receive will
| thus jitter by something on the order of several milliseconds. Also,
| since HF propagation is fairly unreliable, you will need a reasonably
| stable oscillator backing the receiver for periods when the time signal
| is unreceivable.
|
Isn't time information available via C band satellite (TVRO)? I know
that CHU is available on Anik D1 (when the Canadian parliament is not
in session), and I seem to recall details of other time standard broadcasts
available via satellite. Unfortunately, I don't have any specific
information.

In a previous article, TCOMGRD1@OUACCVMB.BITNET writes:
>Whats the diff between baud and bps [bits per second]?

Bits/second is just what it sounds like, the total number of bits transmitted each second. Baud is a term that can be also read as 'symbols per second'. Since a symbol can be either 1 bit, 2 bits, 3 bits, 4 bits, or more, you can vary the bits/second and still have the same baud rate. If there is only 1 symbol/second, then the bit rate and baud rate are the same number. Usually, the number of bits/symbol is an integer, but it doesn't have to be. A symbol time is the rate at which data is truely transferred on the carrier. The It is up to the equipment at each end to encode the proper number of bits in each symbol and to recover them on the receiving end. For QPSK (Quadrature Phase Shift Keying), there are 2 bits/symbol. For BPSK (Binary Phase Shift Keying), there is 1 bit/symbol.

I hope not, since there *won't* be ATV on STS-35. Only packet and voice
will be available; the TV (SSTV and FSTV) equipment is too bulky to fit
in the (severely limited) space available for this mission.

Assuming all goes as planned, STS-37 (scheduled for November, if memory
serves) will include two-way SSTV and *uplink only* FSTV capability, along
with the usual voice and packet.

2991. Longwire antennas for a novice with DX-440

Newsgroup: rec.ham-radio
Date: 1990-05-21 21:46:51 UTC
From: mcmahan@netcom.UUCP
Message-ID: <12391@netcom.UUCP>
Source record: 11487
Cross-posted to: rec.ham-radio,rec.radio.shortwave

I have recently purchased a DX-440 radio from Radio Shack. I would like to receive the station at 10863 KHz. I seem to have antenna problems (not enough gain) for this signal. What is the best way to go? Right now, I have a 35 ft piece of wire soldered to the center conductor of a coax cable (not sure if it is 50 ohm or 75 ohm. Does it matter?) and have the shield of the coax soldered to a piece of copper braid 1/2 wide (I use solder-wick) and have the braid attached to a cleaned water pipe just before it goes into the ground next to my house. Is this kosher? The antenna I have made doesn't seem to work as well as the built-in antenna. How can I improve this? My questions are:

1) Should the longwire antenna be mounted horizontally or vertically for best performance?

2) Is there some method to better match impedances for the long wire? (What is the impedance of a long wire?)

3) Radio Shack sells an antenna kit for this radio. Is this worth purchasing?

4) What other tips and techniques could you suggest?

-dave

Actually, the content of the traffic is probably the lesser concern. The greater concern is that no third party can initiate amateur transmissions without the participation (monitoring) of a licensed ham. Effectively, this means that *all* traffic in the Internet-to-packet direction has to be read by a ham before it is allowed to be transmitted. This isn't a gray area, by the way, in spite of the flaming you may hear to the contrary. It is perfectly clear in Part 97, as I have confirmed by discussing it with Perry Williams, the ARRL lobbyist. Much as I would *love* to see gateways of this sort, it just isn't legal to have an automatic relay from Internet to packet.

Of course, if hams could develop a track record of operating attended (monitored) gateways and show that the traffic flowing through them is benign, who knows? Maybe eventually we could have legal automatic gateways, Internet willing. The trick is to convince the FCC that there is very little opportunity for misuse of the network, particularly by criminals and the like. (You may think I'm kidding about the criminals; I'm not. A few weeks ago W4RI and I gave a packet briefing to several of the FCC staff in Washington, and it was quite obvious that the question of how to identify the originating station of a message was one of their top concerns. Perry later explained to me that they are worried that the ability to send data that isn't monitored by anyone could be used by druggies to establish communications for their illegal activities. Personally, I would think that there are better options for the illegals to use.)

Sure it's legal. They are simply operating a station under remote control.
Nothing wrong with that at all! The fact that the equipment is at your QTH
is irrelevent; this was dealt with a couple of years ago when the FCC ruled
that it was OK to use your own call sign regardless of the fact that you may
be at the location of another licensed station. (As I recall, the question
originally came up at about the time handhelds became popular :-)

>signal, PLEASE send me email.
>
>

Well let's see...the 41st harmonic of 3.579545 MHz (Apple II clock
divided by 4 and also the NTSC chroma burst frequency) just happens
to be 146.761 MHz. IF your neighbor doesn't use an NTSC color
monitor (i.e. doesn't use composite color video output) then you
might be able to change the AII's 14.31818 MHz crystal to 14.320 MHz with
hopefully no bad effects. The new frequency of 14.320 MHz will give
a birdie at 146.780 MHz which should be out of your receiver passband.

An even BETTER thing to do is to STOP the Apple][from radiating!
Try ferrite cores an all wires leaving the unit. IF the Apple II is
really old it will NOT be class B certified.... however the newer
Class B FCC certified Apple II should not be radiating
all the way from your neighbor's house if it is properly configured.
Also on the Class B FCC certified Apple II's there is a flame-spray
zinc coating on the enclosure underneath the paint. There are
unpainted spots where the lid is supposed to contact the rest of the
case to form an RF tight seal. This, along with various ferrite
beads on the mother board, were some of the steps taken to get the
original Apple II to pass FCC Class B standards.

If your neighbor has a very old Apple good luck!

-C.T. WB4HVD

p.s. if your neighbor uses an RF modulator and a color TV
you will not be able to change the crystal freq without
blitzing his colors :-(.

This is not so much STRANGE as interesting.

We gave a NOVICE exam a while back and the guy got his call:

KB5MIJ

As he was pondering phunny phonetics, the best he had discovered
to date had been "Made In Japan". I pointed out that the last
three letters were quite significant-- if run backwards!

His name is JIM.

There is a lady in North Carolina (she and her OM are formerly from 8-land,
West Virginia) whose call is wD8EBI and her name is DEBBI.

Her 610 went in with a stack from a Novice/Tech class at the local club.

What's the probablility that hers fell right without help?

This should be the same as you giving your house key to your licensed ham
friend, who then comes over and operates your station when you are not
around. No problem, as long as you take reasonable precautions.

Twas I John. Hook the unclamped baseband video on your IRD up to your HF rig and I would suggest about a 30 DB pad in the middle. The bird is Spacenet-3 (S-3) transponder 17. The emission is FM and I suspect it is around 20 KHz deviation because I am clipping a little bit using the standard 10 KHz bandwidth found in most amateur rigs in FM mode. The images are sent in APT mode usually using HF modes of 120 lpm and a IOC that matches HF also. I have heard them shift to 240 lines per minute on occasion. The freqs. are around 1.5720 Mhz for the charts and 1.8840 and 1.9315 Mhz for the GOES WEST and GOES EAST images respectfully. They use the standard start and stop tones also.

>Jon, KE3Z

Actually, it was simply recognition of the fact that hams have always considered their callsigns to be personal identifiers, rather than station identifiers, and have always used them as such. Even the people who bothered with using the club call always added "W6xyz at the mike".

As for coming up about the time handhelds became popular, well... Let's just say it was about the time handhelds became popular in Newington. The rest of us had already been using walkies for about 10 years or so.

A friend of mine has about 20 Motorola P-10 Handhelds, all crystalled the same and all with Chargers, Antennas, etc... He is considering selling them however he would like to get a feel for how much people would pay for them. These are all brand-new units with 2 year warranties.

If you are interested in them please send you mail to my address and I will forward it to him. Please no UNREASONABLE offers, he does not need to sell these units.

Phil,

No trouble. WWVB's time code refers to the time at second 0 of the minute, i.e. the on-time minute just past. UT1 is the astronomical time scale, defined by the position of things in the sky, while UTC is the time scale defined by the cesium frequency standard. DUT1 is UT1 - UTC. Leap seconds are inserted into UTC to keep it within 0.6 or 0.7 seconds of UT1 Since the earth is currently running slow compared to the atom, DUT1 starts off positive after a leap second and drifts negative. When DUT1 reaches -0.4 or -0.6 or so, they add a leap second to UTC to make it positive again.

The leap year bit is indeed set during leap years. This is to help radio clocks do day-of-year to month/day conversions (note that the year was included in the time code only recently, so a radio clock couldn't determine what year it was and hence couldn't convert to month/day without knowing the state of this bit). WWVB returns UTC, so the DST bit doesn't affect this, but it does help radio clocks which display the time in a local timezone.

> By the way, aren't there restrictions on the types of things which can be
> posted on some machines in the internet? Like advertisements?

Yes. However the specifics vary from network to network, and do not happen to be exactly the same as amateur radio. To start with, the amateur radio service restrictions originate in federal regulations whereas the restrictions on networks originate in many other places and in different forms. There can be specific policy (e.g. Dod for Arpanet) and implied or specific policies from funding sources. You may even be able to find things that are legal and accepted over ham radio and are technically against the policy of a network.

> Inquiring minds want to know!

This 'enquiring' mind Xray'd the damn thing. It appears to have a voltage regulator, a four bit CMOS counter, and some misc analog voltage/drive looking components. The counter is of the presetable variety and you can see traces on the board where cuts have programmed the devide by ratio of the counter. Our guess is one data line sets the clock, another line strobes it, and the program reads the devided clock on yet another line. We think all of the analog stuff kills this clock circuit when the data strobe is asserted. We haven't tried to defeat it. Since we're a large corporation, we just buy more keys. Luckily, inquiring minds run the Xray equipment.

And back in '83, when I first began working at JPL, one of my co-workers
was AE6S. My call at the time was WA6IRH, but I was quite inactive;
however, when I discovered his call and learned that there were more
weird ones like that to be issued, I got to work on my code and on 18 Nov
1983 I received my new call. However, I had really hoped to avoid the two
letters of my old callsign that I least liked: W and H. Of course, the FCC
knew this and cursed me with them again... It can be a very confusing call
on voice: the N is nearly the equivalent of an "uhh" and so the call is copied
as W6H? . Of course, then there was XE2CCC who never was able to figure out my
call one evening on 40m. I turned off the radio and went to bed. Yeeesh.

There are a number of considerations to be made when using Radio for timing signals. First you have the source. This can be WWV broadcasts, Loran C navigation signals, or whatever happens to be handy. Next you need to consider path length and path route. Radio waves travel faster over water. For high enough accuracy, the path length needs to be determined within 5 meters. This is about the best you can do as far as timing precision. I do have anything detail on this handy, but these type of systems cost in the 10K range. I can get more information if anyone is interested, but I don't know who's question this was.

If you can find out which node on the computer has this harmonic, you
could soften up the signal edges with a small capacitor. Either find
it with a signal strength meter with high pass filter, or look on the
schematic for a clock line that may be overdriven.

Not always... There is a guy who works here who didn't even get a
call sign when he became a ham. His brother was already a ham, and at
the time (late 30's?) the FCC would not issue a second station license
for the same address. So he just got the operators ticket and no
station until his brother moved out.

>Gap Antenna Products of Vero Beach Forida,

The antenna is basically a half-wave vertical on 20 meters with additional stubs to provide matching on other bands. I gave it a look at Dayton a few weeks ago, and my friend N2EA bought one and erected it as described in the instructions sheet. The antenna works very well on 20 meters, but is a complete wash out on the other bands. 40 and 80 are particularly dissapointing.

I would find the room for radials and put up a Butternut if you want to go with a vertical.

Source record: 11429

I was poking around through the ARRL Handbook the other day and came
across this info:

86 Handbook, page 36-3,
Guy Mitchell, WD0DVX passed the code test at age 4 and passed
the written novice test at age 5 with the above resulting call.
There is a picture of him also, but I think the picture was taken
when he was a couple of years older. No date was given when
all this took place.

I am not sure this is the situation that was referred to earlier, but
it is mighty close. Granted, the novice test is trivial, but I still
don't see how a 5 year old could have understood the concepts behind
the questions. It must have been memorized without meaning.

From: kchen@Apple.COM
Message-ID: <41255@apple.Apple.COM>
Source record: 11519

It's bad enough to be invaded on 10m by taxi drivers, but while slumming on 20m last evening (a little after 0600Z), I came across a sideband signal at 14.084 MHz. Sideband at 14.084? Moreover, it is *lower* side-band. Now, what self-respecting Ham would do that? I got curious and listened. Sounded like a bunch of stations (at least 3) conversing in what seemed to me to be the Hakka dialect of Chinese. They were yakking away as if they were on cellular telephone or something. The strongest was coming in with a good S9. Quite likely to be fishermen in the Pacific. Certainly not Hams.

It gets more interesting. When I tuned across again about half an hour later, there is this "fake" CW station trying to jam them. Well, I say "trying" because this lid was at absolute zero beat with them. HI. Didn't do squat to QRM them. He/she was also sending gibberish CW (hey, my morse ain't *that* bad to not be able to read proper CW :-). But, now and then, a couple of CQs and VVVs got through. Smoking gun. A fellow Ham almost for sure. For a while, I though I heard an RTTY signal on top of them, too. But, at that frequency, it could be a legitimate one who wasn't aware that he was sharing the spectrum in an intimate fashion. Anyway, the CW jammer finally wised up and started to sweep slowly back and forth across the LSB signals -- that finally drove the non-hams away.

So. We are not supposed to cause malicious interference. But, has the FCC interpreted whether this applies to interference to a service that is not supposed to be there in the first place? If so, how does one get rid of these strangers?

Would be interesting for 3D2AM to say "listening 14,084, plus minus 5." :-) :-) :-).

Waaay back in the ooollldddd days (pass me the Geritol, wouldja?), say around 1972-1973, the FCC experienced a momentary, fleeting spasm of good-natured-ness and let Extras request a 1X2 callsign. You had to pay a modest fee, but it was well worth it. If they didn't have the callsign you asked for, you could request "next available," as I did. This system was the way that most of today's 1Xmy initials came from. Needless to say, it's too bad that the spasm didn't last.

Hi All!
Well, I thought I had cleared the biggest obstacle to becoming a ham when I passed the code and theory and got credit for my Technician class license (I passed the theory for General and plan to take the 13wpm next month). However, I now find out that I cannot mount an antenna on the tallest point on the house. My Dad thinks that if a strong wind blows, the whole house will fall down (or something like that!). Anyway, I can put up an antenna on the side of the garage. The only problem is, we live at the bottom of a small valley. If the antenna was mounted on the side of the house, a signal that radiated 20 degrees from the horizontal would just about clear the surrounding terrain.
My question is this, is it worth it to mount the antenna on the garage, some ten to fifteen feet lower? Or should I just forget trying to work the HF bands for the time being and buy a 2m HT instead and drive to a higher place?

Thanks in advance,
Andy Greenshields [dxandy@widener.BITNET]

I heard *somewhere* that TEC-200 is just a special type of
transparency film for copiers. Not a special one designed
just for PCB work; just one of the ones that happens to work
well. Can't remember where I saw this, but you might want
to try it. Post results if you do.

Cross-posted to: rec.radio.shortwave,rec.ham-radio

Is there a place where I can purchase or get an audio tape containing valid WEFAX signals? I have written a program, but need to test it on a known good signal and am having severe trouble making sure I have a valid station tuned in and all is ok. I can live with some distortion in the playback, but would like to at least make sure I am doing a reasonable job of decoding the signal. If there is a kind soul out there that could record a couple of WEFAX signals while simultaneously making a WEFAX picture to send me, I would be forever in their debt. With a tape and a picture, I can figure out how to reproduce the picture from the tape and will KNOW what I should get. If there is a shortwaver or Ham in the Santa Clara Valley of Ca that wouldn't mind just doing the recording, I'd like to try that as well. I can live without the picture, but it would be nice to have both the tape and the picture.

I did manage to get one decent copy of a WEFAX signal that is very recognizable, but have changed the software since then and am not able to get a decent picture. I don't know if it is the software or if I just don't have a good signal.

>
> de KB1RB

I've used Tec-200 but I'm not certain that it is different from copier
transparancies since I haven't ever tried the same trick with them. It
definitely handles high temperatures better than some materials. As far as
I can tell, the magic is that it doesn't distort too badly when you heat it
to 275 degrees or so to get the toner on it to come off and stick to the
PC board. Even Meadowlake, the manufacturer, recommends that you trim the
material back to just slightly larger than the actual board you are trying
to make.
I've made a number of boards with varying degrees of success.
Success seems to have a lot to do with how much toner your particular
photocopier can deliver to the film. I've usually ended up going over the
transferred toner with an indellible marker to "fill in" the pin holes.
My next attempt at prototype boards is going to be generate photowork
directly using transparancy film and a laser printer. I think I will
bypass the idea of plotting directly to a board with an X-Y plotter due
to experiences with using hpgl output and difficulty of getting good area
fills.
If anyone else has found successful tricks for moderate complexity
two-layer no-plated via boards I would like to hear about them.

>Please explain, OT's... How did it USED to be?

At the risk of redundancy...

In the Very Early years (up to the early 20s?), calls took the form 1AW, 2YZ, etc. National prefices came into being in the 20s. (The US was NU for a year and then W and K when they redid the scheme.) The FCC gave domestic hams W#xxx calls after the 2-letter suffixes ran out. The K series was used for territories (K6 for Hawaii, etc.).

After the war, the FCC gave Kx# to territories and when Novices were introduced, they got WN#xxx, with the N dropped on upgrade. The W's ran out so K#xxx followed. Then around 1958 WA's began, with WV for novices (in 2, 4 and 6 only, I think); WB's had corresonding WNs. I had a WN2 call in 1965 that would have become WB2 had I stapled the novice to my tech application. (Instead I got a different WB2). The WB2Z series ran out by 1967 so they started reissuing vacant WA and WBs. For a short time in the 1970s WDs were issued in a few districts. (WC was the novice variant of KC, which was the Caroline Islands/TTPI.)

In the late '60s, Extras could request (for $20) a random 2-letter call. In the early '70s, fees were abolished. (Long story omitted.) In the mid '70s, Extras could request a pick of calls (send list of choices); if you were an Extra prior to such-and-such date, you went before those in a later class. I got my Extra in '76 in order to get in the line; fortunately, my first choice (K1IO) was still vacant by 1977 when my turn came up.

Then in '78 or so they adopted the current horrorshow and stopped allowing any choice. They more recently turned down a proposal to allow the ARRL (or another outsider) to administer a u-pick-em program.

[are there really any line eaters out there?...]

In a recent posting, Jim K6ZH <price@marlin.UUCP> says...

>Next there were WA6xxx calls, again issued until they ran
>out which in Calif. was 1962.
>And then there were WB6xxx calls, most of which were
>issued by the early 70s.

While it may be true that the WA and WB calls were all used up in 6-land, they were not in many (most?) other call sign districts (like 1-land). I remember reading ham rags in the 70's where the FCC realized they were running out of WA and WB calls, didn't want to keep going on with WE, WF, WG, etc., and had decided to reissue old WA and WB calls. My impression is that the class-specific call sign scheme we have today did *not* result from running out of a particular call sign format, but rather from the desire to have the license class recognizable from the call sign format (makes policing much easier!).

>And for a brief time the FCC issued WD6xxx calls, but only
>get about 1/3 into the alphabet. No WC calls were issued.

WC calls were issued exclusively to CAP (and maybe MARS, too?) stations.

>Meanwhile, incentive licensing was being implemented
>which brought with it distinctive calls for each class of license,

Incentive licensing was entrenched well before the recent class-specific call sign mania. I've heard that at one time there were only two classes of licenses, "A" and "B", I think. The Novice license seems to be the real beginnings of incentive licensing: make entry into amateur radio quite easy but provide very limited privileges and use the privileges of the "full" licenses as incentive to learn more technically. The full incentive licensing program, established in the late 50's or early 60's, established the present five license classes that tied more privileges to demonstration of more knowledge and skills.

To the comments already posted, I will add...

Prior to the distinctive call signs scheme used now, there were some other noteworthy call sign schemes:

- Novices were issued calls like KN1ABC which were changed to K1ABC when they upgraded. Later they were issued WN1ABC calls which were changed to WA1ABC, WB1ABC, etc. when they upgraded. The point here is that they got to keep their three-letter suffix.

- I think at one time Technicians were issued K1xxx calls at the same time Generals and Advanceds were issued WA1xxx. This would have been in the early to mid 70's. Can someone confirm or deny this?

Yes, the "standardized" test can provide a barrier and perhaps does not test the individual for the proficiency/ability on the subject. But... on a open ended question, essay type of exam you are now subject to the subjective interpetation of the exam grader. This is the sort of thing that makes lawyers hyperventilate and start to look at the latest of hot sports cars. The standardized multiple choice exam on the other hand is very hard to attack because all candidates take the exam. The only thing open for attack is the cutural type bias that may exist in the question. IQ tests are famous for this type of problem.

In the college area, and especially in the lower level everyone-takes-this course that has a 200 student class, the multiple choice, electronically graded exam is the only way you could expect to get a result back in a reasonable period of time.

There was a window for a while in which EXTRA CLASS license holders could turn
in a one-time preferred call list.

FCC would take your list and assign you the highest one on your list that was
not previously assigned.

This was a limited time offer back in the 70's and has not (very likely will
not ever) been repeated.

It ONLY applied to Extras.

From: pete@ctbilbo.UUCP
Message-ID: <105@ctbilbo.UUCP>
Source record: 11438

Is it necessary to send QSL cards to QSL managers in order to get a card from the station worked? Is a simple note to the manager with the usual band, mode, date & time (and SASE or SAE and IRC) good enough?

Do the stations worked ever get these cards? Do they even want them? If not, then we can save money by not sending cards. If we work a station on several modes and or bands, do we have to send a card for each? Again we can save money by sending a list with the info and not the cards.

If the operator worked really does want my card, then I have no problem sending mine, of course, but if the manager tips them, then it's a waste. With even simple cards costing 15 - 20 cents each, quite a cost saving can be had by using a list.

Any QSL managers out there want to comment?

>don't see how a 5 year old could have understood the concepts behind
>the questions. It must have been memorized without meaning.

I know of a four-year old who can read a great deal of the newspaper. Granted, he has trouble with words like Vladivostok, but he groks gross national product and Hawaiian volcanoes. A regular chip off the old block too -- his dad and he were in front of the TV one day when one of the local yokels was making his pitch for Georgia governor. Daddy said [after Mr. Roger's style] "Can you say 'sound bite'?". From then on, the kid sees a political ad, he says "sound bite." Funny thing, the wisdom of children often surprises us all: now, when he sees a TV lawyer who want to help us with "debt relief and settlement protection" and he says "sound bite." :-) :-)

I know very well one individual who could read (granted, with little comprehension) at 1 1/2, pronouncing all the "regular" words very well. He __doesn't remember__ learning to read and, for all he knew, kids were born with things like the Star Spangled Banner and the 23rd Psalm already memorized. His theory is that his grandfather unwittingly taught him to read sitting on pappy's knee while the old man read out loud to himself, pointing at the words and spelling out the letters of words over six characters in length [some times an 8th grade education can accomplish more than that of a Ph. D.].

A three-year old is learning at a rate an order of magnitude or better above a 10-year old. Some don't wait 'til later to get into the meatier stuff.

Let me add to Mike Owens' comment. Back in the ancient days, even before 1972 (perhaps even before Geritol), there were W's and there were K's. If you were one of the Hams from the "brown-shoe" days you had a W prefix. The newcomers all got K prefixes. Novices got a (by that time) KN call (KNnXXX). You didn't get to select. You got what came up, a la today. As a novice you had one year to upgrade to General or else. On upgrade, you simply lost your "N" and your call became KnXXX. If, after a year, you didn't upgrade, you lost your privileges (your non-renewable license expired) and your call went into the dead file.

Andy,
I would put up the antenna on the side of the garage and have fun! You don't say what kind of antenna you have in mind, but it should work. There is a lady out here in net-land that lives in a mobile home park, (read NO ANTENNAS) and she loads up the aluminum carport cover. She has a DXCC so carport covers can't be all that bad! There are plenty of hams living in apartments that can only string up inside dipoles or other less than optimal antenna and get out fine. Just about any antenna you put up will work and give you plenty of fun.
73's and hope to work you some time

>
Yes, you can just send a list on a piece of paper (or a single card
with multiple qso information on it) but there are certain risks
involved. For one thing, this complicates life for the qsl manager
so there is a good chance that your request will relegated to the
bottom of the processing stack. Furthermore, suppose that you work
a station on 5 bands/modes and send one letter. Suppose the manager
finds 4 of the qsos in the log, but can't find the 5th immdiately.
Then (since you presumably sent 1 sase) he will hold up the 4 good
cards until he gets a chance to investigate the 5th. For a busy
DXpedition, this could mean a 6 month to 1 year delay in getting
your cards.

>If the operator worked really does want my card, then I have no problem
>sending mine, of course, but if the manager tips them, then it's a waste.
>With even simple cards costing 15 - 20 cents each, quite a cost saving
>can be had by using a list.

Since when do cards cost 20 cents? You can buy 1000 cards for under
$50. Remember that the qsl manager is a volunteer; you should do
everything possible to ease his burden and speed his processing.
Also remember that YOU are the one who wants the DX stations card.
The DX station is really under no obligation whatsoever to QSL.

I think in general most qsl managers do a fantastic job for no
rewards. We should do what we can to lighten their load.

First, I just got my Technician class license and call sign in the mail from the FCC. It took exactly 5 weeks and 2 days from test day.

I've been shopping around for a 2M HT. I just realized that almost all the HT's are FM and that all the repeaters are FM. But I've been listening to the 2M band on my Sony Air-8 AM scanner. Am I very confused? Or is slope detection or some other form of parasitic detection that good?

Thanks,

MCL9337@TAMVENUS.BITNET

It used to be that Extra class hams could choose their own call. This only lasted a few years (like 3 or 4) and was phased in gradually, with the old-timers getting first choice. I was fortunate enough to have the Extra during the time this was in effect.

Also it used to be that ANYBODY could request a previously-held callsign to be reassigned to them. I remember when they started issuing non-WN callsigns to Novices, one fellow requested his old WN call back (since it was now not officially a Novice callsign.) He got a lot of flack when he used it on the 2M repeaters.

Will you be on VHF? Probably 1200 baud, unless someone is doing something
unusual in your area. At HF you would run 300 baud.

> And last, but not least, Could my current modem be used for packet at all? I

No.

My dad's call was W2UM, when I used it for cw contests it
usually came out as :
W22 .-- ..--- ..- --

and mine at the time was WA2JAM which often was heard as
WA2JJ .-- .- ..--- .--- .- --

then I had VE2AXW in Canada for a while, that one was a
bugger on phone as well as cw. I gave up the fight and
and requested my current call

K3FR -.- ...-- ..-. .-.
"KING THREE FRIED RICE"

That one got a lot of chuckles and tickled K7FR enough
that he picked up the phonetics for his own call.

>
> I hate to pick nits, but shouldn't the above read "If there is 1 bit/symbol,
> then the bit rate and the baud rate are the same number."

One of the problems I have often had in grasping new concepts is the poor choice of terminology. This is one of those cases. When I was originally learning this about bit rate and baud rate, the term "symbols" resulted in a lot of confusion because I had a different understanding of the term. In actuality, both this usage, and the understanding I had were correct; the term has a very broad usage. The problem is that even if I did know the full meaning of "symbols" then I would not have known what was meant anyway.

Symbols are a member of a set of values. Characters are symbols. However in the usage as it relates to baud rate, it really is referring to the modulation symbols, or more specifically, the values the modulation can have. If the modulation can emit 20 different values in one second then the baud rate is 20. At each of those 20 positions in time (or space) the number number of different values that could appears might be very large or very small, but this does not affect the baud rate.

Bit rate refers to the number of data bits that can be encoded in some sequence of these value symbols. Usually the "encoding" is very simple as in FSK where there are only 2 values (space and mark or 0 and 1) to choose from. Only 1 bit can be encoded for each value, so this is the case where the number of data bits equals the number of values in a given time period and the baud rate equals the bit rate.

If there were 16 different data values to choose from at some point in time, then you could encode 4 data bits in that one value. In this case, the bit rate will be 4 times the baud rate. If you transmitted 1200 of these data values each second, you would be able to transmit 4 bit for each one, or a total of 4800 bits per second.

When a single value can be chosen from a set of 2 possibilities, we can easily think of this in terms of understanding the 0/1 or off/on state of digital circuits. If there are more than 2 values, then it becomes more difficult. One possibility is to have 16 different voltage levels with a circuit that can detect which is it. Noise immunity would be less because it would only take much less voltage as before to fool the circuit. Yet another, and more common, way to encode multiple values is to deal with a sinusoidal carrier in the complex plane. Imagine an array of 4x4 dots. Assign a number from 0 to 15 to each one. Now put a 17th dot in the center. The center dot refers to the carrier being turned off. A line from the

center to any dot is the vector value. The length of the line is the amplitude of the carrier at that time and the angle of the line is the phase angle of the carrier.

I need plans for a simple He-Ne Laser power supply.
It must be 1700 V at a min of 6 mA. I have a 0-50 VDC 0-30 A bench power supply which I wouldn't mind incorporating, I would like it to allow me to vary the 1700 V. I have seen laser power supplies that ran off of 12 V car batteries but I have not seen the schematics for these.

Any Info is appreciated.

>

Yes! The stations usually end up getting the cards, even though there
may be a couple years of delay in the process. I was operating KC4AAA
at South Pole last year 13 months and had a QSL manager back in the
states handling everything for me. When I returned from my trip in
December, there was a box of 2,000+ cards that had been answered
awaiting whatever plans I have for them.

Will these cards ever be used? Yes, I'm SLOWLY going through them for
my DXCC and whatever other awards that would match the decor or my room.
Now, however, I'm just trying to separate them into three piles, USA,
JAPAN, and real DX; and the cards keep coming! The U.S. ones will
probably get used for a WAS award. But realistically I'll have many
more U.S. cards than I'll know what to do with.

So, if you're a U.S. ham working a D.X. station, chances are he won't
NEED your card, and a note with the contact info will suffice. BTW,the
note will even count as a "QSL" should the D.X. station wish to submit
it for an award. But he can also look you up later should he want a
real card. All cards are appreciated, USA included(!). And in my case,
all cards are being read.

Posting on behalf of Mr.Cadet Rick Yoder

Subject: Shortwave/Teletype Reception

I recently bought the Teletype conversion program for shortwave bands
(up to 26100 kHz) from Software Systems Consulting. My reception problem
stems from the fact I can't have my radio (a Siemens RK651) more than 3 feet
from my computer. I've grounded both and it doesn't seem to help much. I have
an antenna that runs out my window and up to the roof.

It's a typical shortwave listeners setup, and I'd really like some
advice on some how shielding the radio from the computer's emissions, or
inducing them down another path than my radio. Also, does anyone from the
NorthEast have any verified teletype freqs? I live about 52 miles north of
New York City. If something doesn't improve, I just waisted money on this
software.
Please mail replies to x13689e2@usma3.usma3.edu

Thanks in Advance,

Cadet Rick Yoder

Many thanks to all the hams that responded to my "useta be" request on the callsigns! It's made for some lively reading here, lately.

I really enjoy hearing about the way ham radio was in the past. There really have been so many changes, and we should never forget where we came from!

It is a pity that there is less homebrew nowadays, what with the complexity of the radio world. But there are still challenges in ham radio, and all you guys (and ladies) make it all so worth it!

I had my first CW QSO since about a year ago on 40m tonight with Dube Todd. It was great to get back on HF again after so long.

This is one of the greatest hobbies there is. I try to get ALL my friends involved, at the risk of making them tired of hearing it, but what the hey!? We won't get any new hams by not talking about it, will we?

We should have an INFO-HAMS net sometime. Nothing political now!!

I found this in comp.dcom.telecom:

From: moscom!de@cs.rochester.edu (Dave Esan)
Newsgroups: comp.dcom.telecom
Subject: Joined Countries
Message-ID: <8172@accuvax.nwu.edu>
Date: 23 May 90 15:06:56 GMT
Organization: Moscom Corp., E. Rochester, NY

The Yemen Arab Republic (country code 967) and the People's Democratic Republic of Yemen (country code 969) announced recently that they will merge and form a new country called (surprise) Yemen.

Has anyone heard or thought of what will happen to the country codes? Will they merge into one, or will the North still be 967 and the south be 969?

When Tanganika (255) merged with Zanzibar (259) to form Tanzania they kept both country codes. Of course, Zanzibar, an island, is physically removed from what was Tanganika.

Does anyone know the intentions of the soon to be united Germanys in regard to dialling patterns to what is presently East Germany (DDR), and which will soon be part of a single Germany?

Thanks.

--> David Esan {rutgers, ames, harvard}!rochester!moscom!de

Does this mean that 4W or 7O is going away? Gee, and we're probably going to lose one German prefix, too. We've got to put a stop to all this global gemutlichkeit before we wind up with only two or three countries on the DXCC list. :-) :-)

But seriously, anyone know what the scoop is on this one?

Patty

3057. MARS Affiliation

Newsgroup: rec.ham-radio

From: 1843EIG/EIE
1843EIE
Dept: 1843EIG/EIE
Tel No: 656-1158

TO: Remote Addressee (_INFO-HAMS@WSMR-SIMTEL20.ARMY.MIL)

Subject: MARS Affiliation

Dube Todd asked, so I thought I'd post this for everybody's benefit:

The Military Affiliate Radio System (MARS) is a Department of
Defense sponsored program, and each military department (Army,
Air Force, and Navy/Marine Corps) runs its own MARS program. You
can only join one at a time.

The MARS mission is to provide Department of Defense sponsored
emergency communications on a local, regional, national, and
international basis as an adjunct to normal military communications.
It also provides auxiliary communications for military, civil, and
disaster officials during periods of emergency. The MARS program
also provides morale and quasi-official record and voice communications
traffic for Armed Forces and US Government personnel stationed
around the world.

The requirements to become a MARS affiliate are as follows:

1. Be 14 years old or older (parental consent required under age 17).
2. Be a US citizen or resident alien.
3. Possess a valid amateur radio license (Note: Novices must upgrade
within 12 months of entry into the program).
4. Possess a station capable of operating on MARS HF frequencies.
5. Be able to operate the minimum amount of time for each quarter (12
hours/quarter for Army and Air Force; 18 hours/quarter for Navy).

The benefits of MARS membership are:

1. Being part of a worldwide communications network supporting vital
US interests, and contributing to the welfare and preparedness of the
nation.
2. Increasing your radio skills by specialized training and participation
in structured traffic nets.
3. Operating on specially-assigned military frequencies using SSB, RTTY,
CW, and packet.

4. Participating in the MARS Excess/Surplus Equipment Program after six months of membership.

OK, that's the official line, now here's my pitch:

I've been in the USAF MARS program since September 1985, and have had a blast passing traffic, participating in military open houses, and other activities. Some MARS affiliates get together and operate Field Day and other contests, so your activity isn't necessarily limited to military activities. The 12 hours/quarter requirement may sound like a lot, but it works out to just 1 hour a week. With today's solid state rigs, getting on the oddball frequencies isn't a problem at all -- that's why you see "MARS capable" or similar wording in many equipment ads. The Excess Equipment program can yield some real gems and, quite frankly, some real junk; however, hunting the stuff down is half the fun! Before Novice Enhancement, MARS was a good way for Novices and Techs to get on HF SSB; it still serves the same purpose, although you'll never be able to work DX on a MARS net like you can on 10 meters.

The May and June 1990 issues of "CQ" also have information about MARS.

So you think MARS may be right for you -- here's how to get more information and membership application forms (USAF MARS only -- I don't have the addresses for the other services):

1. Contact the Chief of Operations of the Communications Squadron or Group at the Air Force base nearest you, or
2. Write to: Chief, Air Force MARS
HQ AFCC/DOOCM
Scott AFB, IL 62225-6001, or
3. E-mail me at 1843EIE "AT" HICKAM-EMH.AF.MIL.

3058. Dongles?

Newsgroup: rec.ham-radio
Date: 1990-05-24 09:07:49 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <24.May.90.10
Source record: 11454

Whats in a dongle? well most of the dongles i have come across make use of the
SERIAL port (COM1/2/3/4) on an IBM-PC. There appears to be a single large
IC inside the dongle i have for AutoCAD(tm).
I have a protocol analyser, so someday, i may try to see what the dongle does.
Some of the early dongles were a simple AND-gate driving an oscillator.
The software raised control-lines on the interface in a particular sequence
and the oscillator started. Output from the oscillator was routed to one of the
input pins of the RS232. A software counter/timer in the PC software looked
at the input pin for a known time, and clocked the number of transitions on the
relevant pin; looking for the 'right' oscillator frequency. If it got
the right number of counts, all was OK and the software executed.
Otherwise, the software gagged, saying 'no lock device installed'.
If you had a frequency-counter and a signal generator, you could find out the
necessary frequency, and fake the presence of the dongle. However some software
tested for the dongle at times during EXECUTION (not just at load time!) so
sometimes this approach failed.

3059. The Future of Call Signs

Newsgroup: rec.ham-radio
Date: 1990-05-24 11:13:36 UTC
From: pescatore_jt%ncsd.dnet@GTE.COM
Message-ID: <9005241113.AA03455@bunny.gte.com>
Source record: 11384

Way back when you could request call signs if you had an extra, I went to the NY City FCC Office to take the extra test. It was only open from 0900 - 1100on Wednesdays, and it was quite an adventure for a 9th grader to get into the City from Long Island (I was licensed at 12, went for the extra when I was 14 OR 15), especially during the week when you were supposed to be in school. After walking to the Long Island Rail Road station instead of high school, taking the LIRR into the City, figuring out which subway line to get close to the FCC office, finding the FCC office, etc. I got there at 0915 and was told" "Go away, kid, we give the code test only at 0905 SHARP. AND WE MEAN SHARP. Thoroughly traumatized, I did get my advanced but it wasn't until I moved to Maryland 7 or 8 years later that I went back for my extra.

Which explains why, surrounded by great contest calls like N2FB, K3SA, N3RR, K3ZO, etc., I still have a humongous call like WB2EKK. I've had it now for 20 years (wow, I'm an old fart! QCWA here I come! I will soon remember stuff in the "25 Years Ago" column in QST) and it has sorta become like a middle name. I just can't convince myself to trade it in for NZ3Z. Maryland has just about run out of those calls and is starting in on WA3x type calls. If I could be assured of becoming W A 3 DAWG I might go for it, but until you can choose your own, I guess I'm stuck. I guess it will be many, many years until they actually run out.

By the way, local guys here who work at the FCC say the reason the buy you r callsign proposal was ruled out was because of the increase in manpower required to make sure that monitoring and field offices had the latest callsign info. sounds kinda hokie to me, with about 500,000 hams at 100 500 bytes per entry, that is still only a 250 MB data base. I think most high school hackers could handle that on their dad's 386 machines.

Oh, well, meantime my advice to you rare DX stations is to work all the long calls in the pileups first to get them out of the way. Then call the KM3T and K6ZHs of the world! 73 John Pescatore W B 2 E K K

3060. Callsign restructuring

Source record: 11390

To Patty Winter @ Apple.Com (I don't know how to capture previous text yet)

I got W9IP because they didn't have any of my requested callsigns left; I indicated "whatever is next" and they gave it to me. I didn't ask for my initials because I wanted to get on EME. "W9MO" would have wreaked havoc on EME because M and O are used for signal reports. As it turned out, W9IP wasn't too bad because I lived in Illinois where the electric company is Illinois Power. However, here in New York people only toggle to the obvious implication of my callsign.

Source record: 11385

As a new ham of 2 months (disregard the General Callsign; I got lucky), I could use some advice on desireable features on a new 2m HT. I have around $300 to spend, and intend to use the radio for ragchewing on the local repeaters and to try some packet activity. Of course, all the manufacturer's ads just list features and acronyms and I have no idea what it all means!

Please feel free to offer an opinion on what I might want to look for in a radio. Any specific suggestions on units in my price range would also be helpful. As an aside, comments on a reliable TNC would also be useful. I don't think I need a multimode, but is there any disadvantage to not getting one?

Thanx to all, in advance, for any info...

Message-ID: <XX.180.20673.643554522@XX.QMAIL>
Source record: 11386

While stationed in West Germany, I held three DA prefixed calls two of which were based on my last name (i.e. Taggart). They were DA1TA and DA1TG. The best one however was the last one I held because of the phonetics I derived for it. The call was DA1AV. I was in the Army and had (still have) a very deep voice so the phonetics became Department of the Army's number 1 Amateur Voice. All these calls were issued by the DBP and not selected by me.

Of course I also liked HL9AA while I was the Korea Area MARS director but that's another war story.

I think though that I probably have the worst stateside call for voice at least since no one but me seems to be able to say it without either biting their tongue or ending up calling me Ray. It's K8RYA. Doesn't look that hard but try it on the air!

Bob Taggart - K8RYA

Its interesting, Ken. Of all the calls listed above, I think that
the call you actually got is the best! At least, from the
point of view of cw contesting, your call is clearly best.

Though not a precise answer to the above, here in 2land, I went down to the NYC FCC office and passed my Tech test (had no license before), in the summer of '76. Got issued WA2ISE, which had been used before. Once looked for and found the previous user in an old callbook. Someone in upstate NY.

If I should ever get around to learning 13wpm and get a general or advanced (I'd take the advanced test anyway), I'll still keep my current call. I like W's. and also, when I tell ordinary people about amateur radio, and mention my callsign, people can relate it to the local broadcast radio stations, as both begin with W. Though the two services are much different, the similarity of the calls helps establish that amateurs are a radio service, and not some sort of phone modem computer thing, etc. More obvious than if I had an N, K, or A call. (I would like to see a broadcast station "NERD" :-))
(anyone get assigned N3RD :-))

Subject: Call Signs
I got my original Novice call: WV6VVV through the lottery
What a bummer on CW. A string of Vs was the universal test signal then
so no one ever came back to me. Nowdays people use "test" strung together
as one letter so my call is no longer mistaken. My only regret is that I
no longer have a copy of my novice QSL card. I was so relieved to get
the General that I must have tossed them out. Doc, W6ZRJ, was one of
my high school teachers and it was obvious that my grade would be affected
by not making General that semester. I've been in situations where my life
was in danger, but it just wasn't the same as taking the General test in
the S.F. FCC office at age 15.

My "Elmer", W6ATJ, had a great call. didah Dah! DIDAADAAADAAAAAHHH!!!

Then there's a big gun DXer in San Francisco whose call is W6AWT- I don't know if he's still around or not- anyway he liked to stretch out the "T" to make sure everyone got it right- didah didadah DAAAAAAAAAAAAAAAAAHHHHHHHHHH!! The guy had such a hairy signal that I could I can still envision the white-hot PP 2000TH plates and the neighborhood streetlights dimming in synchronism with his keying.

I worked a guy in the '50's whose call was K6ESE. dit dididit dit. I wonder how many people wanted to add a "didit" to the end of that call.

Only dyed-in-the-wool CW freaks like myself can appreciate this type of humor...

Since the sun has such a major effect on radio propagation, I thought I'd mention that I've been reading a book on solar phenomena that might be of interest to people on this list -- THE RESTLESS SUN, by Donat G. Wentzel (1989, Smithsonian Institution Press, ISBN 0-87474-982-4, 279 pgs, no price indicated on dust jacket). I found this at the St. Louis Public Library; it should be available at many public and school libraries.

This looks to be a pretty good overview of the current thought about solar mechanics, behavior, and cycles. There is some degree of coverage of the terrestrial effects of solar activities, but the emphasis is on the the reasons behind the sun's actions. Reading this might make the solar forecasts and reports on the various DX programs and ham bulletins more understandable.

When I got my novice ticket in the mail I was very surprised and happy
to get not only my license but what I thought was a pretty neat call,
KB2GLO. I am now General licensed and plan on getting Advanced soon.
I really like my suffix but often think I'd like to get a shorter call
for contesting... I even like the rythm of it in code. I don't know maybe
I like it because it's mine and I've heard it so often that to me it just
seems to bounce along, and no body ever got it wrong on CW. On voice though
it seems alot of people think it's KB2GLL. This even happens on the 2 meter
repeaters. I just find that I try to say LO more distinctly but for some
reason new contacts sometimes thinks it's LL this has happen sometimes even
when I gave the standard phonetics. Some people just don't get it until
I tell them the suffix is like GLOW. I guess it works both ways. I mean
there are some calls that are fine on CW but are harder to copy via voice!

I had a Novice license at age 6 in 1963......had my picture in QST and
everything (KN3ZIM). Doug is right --- it was basically rote memorization
without understanding the concepts. Thinking back, I remember it took
a lot of cajoling from my (well-meaning) parents to even sit down at my
little station (Hallicrafters SX-140 and HT-40....no VFOs then). Only
made a few contacts, and once the license expired (1 year term, nonrenewable)
I let the stuff gather dust. Outside of a brief nerdish
encounter with the hobby as a 2 Meter lid [my term, not an indictment of
everybody on VHF, so no flames please] during the mid '70s CB craze
I haven't been on the air (or wanted to be) for a long time.

Don't push kids....it's just not worth it.

When I was a teenager living at home, I was not even permitted an antenna outside of my basement bedroom. So I built an 80 meter helical whip on 3 feet of 3/4" dowel with 14" of copper out the top. It's useful bandwidth was about 10khz. but it loaded and I got 579 from a couple hundred miles with 75 watts (DX-60) from the basement .... part of the fun of Ham Radio is experimentation, try various antennas where and when you can build them. One of these days I will get something like a beam and tower. But in 15 years of activity in Ham Radio ... I have had lottsa fun!!!

>What about the poor soul who gets KO0OO? :-) (For computer displays that
>don't distinguish betweens Zeros and Ohs, thats Kilo Oscar Zero Oscar Oscar.)
>Should be a legit Advanced call, no?

This reminded me of a cute story told to me by a friend who happens
to own WA6OOO. Darrel was driving up along highway 101 between Santa
Barbara and San Luis Obispo some number of years ago in his old
beat-up orange VW station wagon. Darrel has had call plates on
this car for quite awhile...Anyway, he's minding his own business
and obeying the speed limit(probably no choice on that count ;-)
and a CHP officer decides to pull him over.

The officer walks up to him a says in an alarming fashion "Mr., I
hope you have a registration to match that license plate of yours!"
Now at this point it would help if you all knew Darrel just
a little bit...he's got just a bit of the Devil in him...he knew
this and had been waiting for the setup for YEARS. He just
smiled at the officer and said "Of course I do officer" and proceeded
to reach into the glove compartment and fetches the registration
then hands it to the CHP officer. The cop walked away from the
car scratching his head to go run the registration...Darrel was
thoroughly enjoying the cop's consternation...The cop's confusion
stems from the fact that in California at the time trailers were
issued a 2 letter, 4 number series....like wa6000.............
I gather it took the officer a while to call in the license plate
correctly and Darrel didn't offer the officer any help either.
Finally the officer came back up to him and asked "Why didn't you
tell me it was a ham license plate?!?" Darrel just smiled again
and said "Youd didn't ask."

Just for pedantry, the angle is not normally the phase angle of the
carrier relative to some absolute phase reference, but the phase shift
between the previous symbol and the current one. That way the
modulation scheme is self-clocking.

Also, the 4x4 grid isn't quite square; it's more of a pincushion.

+
+Are there any mods for the Yaesu FT736R? I checked the mods
+database, but didn't see any. I'm most interested in extended
+receive, but if you know of any mods, I'd appreciate hearing about
+them. Thanks.

I modified mine. There's a catch tho - the mod involves adding a pair of switches to the module-address lines into each of the rf modules..it's kinda funky but it does work. Look at your schematic, then wire up the switches such that your 2m and 6m modules *think* that they're 440MHz modules! The trick then is to look at the display, which reads 443.000, and mentally adding 6.0 such that you know the real frequency is 49.000MHz.

Similarly, the display will read 445.000 when the 2m module is really at 145.000. When you finish adding the switches, you'll have to powerup the '736 with the switches in the 'extended range' position. Then use one of your existing memory frequencies, transferred to either the A or B vfo, to then bandswitch up or down to the 440 band. Bingo! If you goof, the display will read "error". Start over by powering down, and then repeat the procedure. Sometimes the frontpanel logic will simply lock, just start over and it will eventually work. Mine never takes more than 2 tries. With the switches in the 'normal range' position the '736 will function as a stocker.

The range for the 6m unit is therefore 46-56 MHz, and the 2m unit will give you 140-150 MHz. Yes, the transmitter will also work this span, but keep in mind a 10 watt signal on the 49 MHz band sticks out like a sore thumb! ;-) ("Wow! Listen to *that*! He must have a better walkie-talkie than these RadioShack junkers!") ;-)

My attempts to modify the range on the 430 MHz rf module have not meet with much success, and a careful look at the schematics/numbers tell the story quite well; The module covers 430-440, a 10MHz range. Therefore, the address-line trick will yield no more coverage. The base reference crystal might be changed, but then you'll have to tweek the coils to put it into resonance. I've considered adding a submini-step relay, a pair of crystals and a pair of extra coils. This would give the module 420-430, 430-440, and 440-450 as it's total range...I'll let you know if it works..or maybe you could try it and tell me!

You will discover (if you play with the address lines) that the front panel processor has code in it's ROM to display the numbers for 1.6-2.0 MHz, 3.3-4.0 MHz, 7.0-7.2 MHz, 10.0-10.5 MHz, 18.0-18.5 MHz, 21.0-21.9 MHz, 24-25 MHz, 27-27.5 MHz, 28.0-29.7 Mhz, 50-54 MHz, 70-71 MHz (really!), 143-149 MHz, 220-225 MHz, and the 2 ranges for the

430-440/440-450 Mhz bands. I know that Yeasu made an HF module that was able to do 20,15 & 10 meters, and that there was a module thta was available only-in-Japan to do the 70-71 MHz band. The 220-225 MHz range never wound up as an available unit. Too Bad! I'd guess that one could be constructed from a spare 2m module, given some extensive changes.

There is also the possibility of adding more modules to the '736! Yup. I've seen a couple that have a 4th module added 'outboard'. Look at the schematic, you'll notice that the module-select is capable of it, but watch the line lengths! It's also possible to add some more switches to put more than 4 modules on! Think of it as a shift-key...;-) My only lament in doing these sorts of things is the lack of a proper cabinet and/or overloading the poor power supply.

Have Fun, 73! C U on OSCAR!

I'd guess Bob Parnass might know the answer to this ....

When President Bush was here in Austin last week I cranked
up my BC-210, R-7000, and MX4000 to listen for possible secret
service/Air Force-1 activity.

Question:
Much to my surprise I found a local AM radio station (KLBJ-AM) using
407.750 MHz as studio-to-remote director's link. 407.750 MHz is
also one of the White House's secret service freuquencies...WHAT GIVES?

Incedently, I found the Ex-presidential detail frequency of 165.212 MHz was
the only activity in town. Probably covering Lady Bird Johnson.

The AF-1 phone patch frequencies were silent but later I found out
that Bush had taken a helicopter to Austin from Houston so AF-1
never landed in Austin hence no AF-1 activity.

Funny what you can learn when the President comes to town!

3079. MININEC3 Primer (LONG)

Newsgroup: rec.ham-radio
Date: 1990-05-24 21:34:39 UTC
From: harrism@rtpsql0.rtp.dg.com
Message-ID: <1990May24.213439.16068@dg-rtp.dg.com>
Source record: 11473

Here is some help for new mininec3 users who don't have the manual...

Segments - you need to tell it, for each wire, how many pieces to
break it up into for the computations. In general, the more segments,
the better the accuracy, the slower the computations. You should
typically use an even number of segments.

Pulses - pulses are assigned to portions of the wire based upon the
number of segments. Chose the pulse (for source or load) based upon
the endpoint coordinates for each pulse. (Look at the geometry
output). The pulse will be applied to the middle.

Source pulses are how you feed your antenna. the assigned pulse
number located where you want to feed it is the source pulse number.
Normally chose a voltage of 1 volt and a phase of zero degrees

Load pulses - these would correspond to loads such as traps, resistors
(as in a rhombic), etc. You normally don't have theses.

As an example, take the following wire: (remember - dimensions are
in meters....)

0 -5.277 10 5.277 0 10

This would be (roughly) a 20 meter dipole at 10 meters high. The
program will compute the connections based upon the coordinates.

chose the frequency (say 14.2 Mhz).
enter the wire and specify 10 segments
use a diameter of, say, .002 meters

Note that pulse number 5 cooresponds to the middle of the antenna.
(obained from the mininec3 geometry report)

specify pulse 5, 1 volt, 0 degrees for the source
specify zero load pulses

Tell it to compute currents.

I got an impedence of (77+J40) for this run.

Tell it to compute far field patterns,.....

The key is to run it once, with output to disk or printer to get
the antenna geometry and pulses, and then to run it again once you
know this info (scrolls by much too quickly)...

A handy aid it to use mnpre to pre format input for mininec3 based upon
file input. Remember that mnpre takes a xxx.NEC file and generates a

mininec.INP file (you lose the xxx part), and mininec3 will *not* ask
you for geometry input if it finds the MININEC.INP file laying
around.

The format of the mnpre file is:

GW,,pulses,x1,y1,z1,z2,y2,z2,diameter

with a line for each wire.

thus, the TEST.NEC input file for our sample run would contain the
following line:

GW,,10,0,-5.277,10,5.277,0,10,.002

Now, part two of the series answers some common questions and hopefully
fills in all the gaps.

------Real questions and answers follow-----------------------------------

> Fantastic, all is approaching elightenment.

I always get worried when that happens.....
>
> Only minor problem is that if I have a "bent" wire, such as an
> inverted-Vee, do I put that in as TWO wires which have a common end - does

yes. Anything that isn't straight has to be broken into discreet straight wires.

> MININEC assume wires with coincident (X,Y,Z) are in fact connected?
> And if they are in fact insulated, do I just specify slightly different
> (X,Y,Z)s ??

yes, and yes.

> Doesn't feel right cos it seems too easy! Will try it in a second! ...

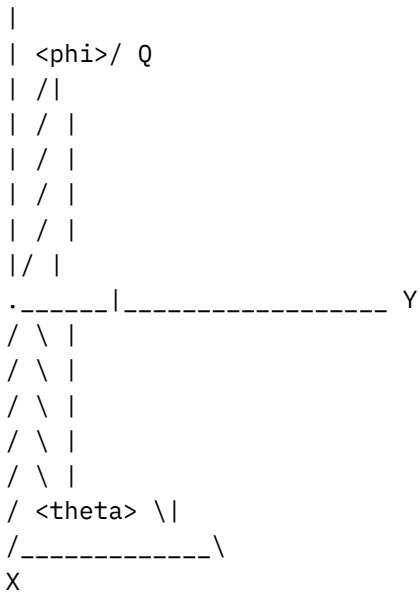
> I think I am getting my orientation in free space confused ... which only
> matters when there is ground --- and when I visualise
> ZENITH AZIMUTH VERTICAL HORIZONTAL

For the coordinate system, imagine you were looking at the antenna.
X would be a distance along the ground pointing at you; Y would be a distance
along the ground pointing 90 degrees from X, and to your right; Z is the
altitude above ground.

For Zenith, imagine your hand pointing straight up at the sky. Then rotate
your hand towards the horizon, say 10 degrees. This is a zenith angle of
10 degrees. Thus, the horizon is at 90 degrees. (I looked at alot of strange
pattern plots until I figured this out).

For Azimuth, the angle is the angle between the X axis and a ray rotating
towards the Y axis (looking down from the (0,0,Z) axis, it rotate counter
clockwise).

Z



where theta is the azimuth angle ane phi is the zenith angle.
Rotating away from Z towards the point Q is positive zenith angle.
Rotating away from X counter clockwise is a positive azimuth angle.

Part three concerns connections. While mininec3 will automatically
compute connections for you, you should check it's geometry output
to ensure that YOU didn't make any mistakes. You can do this by
checking the connection data of the geometry output.

A connection value of

zero indicates that the end of the wire isn't connected to
anything (*yet*).

a negative integer with a magnitude equal to the wire number
indicates a connection to ground

a negative integer with a magnitude less then the wire number
indicates a wire junction. Specifically, it indicates
that this end (end1 for example) is connected to the
same end (end1 again) of another wire. For mininec3
this number should be the wire number of the previously
defined wire that this wire connects to.

a positive integer with a magnitude less then the wire number
indicates a wire junction. Specifically, it indicates
that this end (end1 for example) is connected to the
other end (end2 for example) of another wire. For mininec3
this number should be the wire number of the previously
defined wire that this wire connects to.

I complemented this by writing a script that takes .NEC files and
display's them with xgraph. Most errors show up right away!

The demand for help hasn't been swamping me, so I'd be glad to
help people get started (I'm not an expert - I just have the
manual!) I've been having luck with X-beams and V beams, but
a friend has been having trouble with "parallel" dipoles.
Play with it!

Hope this gets you started - good luck!

Does anyone out there hapen to know what a 'damped wave' or 'B wave' is?
They're mentioned in the FCC rules, Title 47, part 97 (that's us, boys!)
and are _strictly_prohibited_. Is this some old spark-gap stuff, or is
it a vague reference to 'Berthold Rays' from Star Trek? Inquiring minds
gots'ta know....See ya on DaveTV (427.25, 439.25)

>three countries on the DXCC list. :-) :-)
>
>But seriously, anyone know what the scoop is on this one?

I can speculate. It would seem that the proper thing to do would be to delete *both* PDR Yemen and (the other - is it Arab People's Republic?) Yemen and add a new country for the merged Yemen. Remember that Germany was deleted to make way for E. and W. Germany. I also suspect that when the two Germanys merge, we'll get *back* the deleted Germany, but E. and W. Germany will become deleted. Sounds like a net loss of 2 current countries (Yemen+Germany-DL-DM-4W-7O) and a net gain of 3 deleted countries (DL+DM+4W+7O-Germany) to me. But it'll only put me one country closer to the honor roll, since I've never worked either Yemen.

3082. Advice needed (requesting permission to monitor)

Newsgroup: rec.ham-radio
Date: 1990-05-25 00:30:45 UTC
From: judice@sulaco.enet.dec.com
Message-ID: <9005250030.AA00582@decpa.pa.dec.com>
Source record: 11391

Help! Advice needed!

Without going into details, in NJ any radio that operates on police frequencies is illegal in vechicles, unless you obtain a permit from your local police chief. The general belief is that such permits are impossible to get, unless you are on a local rescue squad.

Since my prime interest in radio is monitoring railroad frequencies, specifically Conrail, on a whim I wrote to my local chief, politely asking for such a permit. To my shock, he returned a letter saying YES, provided I gave him:

1. my reason for asking to listen to these frequencies.
(no problem).

2. "provided you present me with proof that Conrail has no objection to you monitoring them".

This brings many questions to mind:

1. Will Conrail provide me with such proof?

2. How should such a request be worded/phrased to eliminate a negative reply?

3. Is "proof" the fact that under the ECPA and Communications Act of 1934, Conrail hasn't any business objecting ANYWAY?

Any ideas??? Thanks very much,

Lou Judice

I spoke with the original poster of the mod to the net (you know the
one that includes step-by-step doxs). He said the mod does kill data
entry in the 30-54 range BUT freqs already entered will still scan
and receive. So it looks like a small momentary contact switch will do
the trick. I havent gotten chance to try it yet as ive been busy with
other things.

From: wheatley@cbnewsk.att.com
Message-ID: <1990May25.045558.1077@cbnewsk.att.com>
Source record: 11379

In article <105@ctbilbo.UUCP>, pete@ctbilbo.UUCP (Pete Ritter) writes:
> Is it necessary to send QSL cards to QSL managers in order to get a card
> from the station worked? Is a simple note to the manager with the usual
> band, mode, date & time (and SASE or SAE and IRC) good enough?

I do qsl cards for some 20 active stations. For me, as long as the
note contains the 'information on a qsl card' (i.e., I should be
able to use the note for an award if needed) then I am happy. Just
don't put the information buried throughout a 3 page letter telling
me about your life. I do 100 qsl cards every few days, so needless
to say, I probably won't get to that one!

>
> Do the stations worked ever get these cards? Do they even want them? If
> not, then we can save money by not sending cards. If we work a station
> on several modes and or bands, do we have to send a card for each? Again
> we can save money by sending a list with the info and not the cards.

Cards are not necessary, just convenient. Just got a was award by
sending in a post card where someone carefully wrote out the qso
details longhand. Stations sometimes get the cards, sometimes
not...it depends. Usually, the dx station is casually, at least,
chasing some award or another. If money is the issue, take your
card, or design a card, and go to a print shop. size isn't too big
an issue...you can probably get 10 pseudo-qsl cards on a 8.5x11
piece of paper....and this will do for most purposes.

>
> If the operator worked really does want my card, then I have no problem
> sending mine, of course, but if the manager tips them, then it's a waste.
> With even simple cards costing 15 - 20 cents each, quite a cost saving
> can be had by using a list.

not sure where you buy your cards....but W4MPY sells something like
1000 'basic' qsl cards for $31.45 (see march/april 1990 National
Contest Journal, page 32 or write him callbook address). These
cards are quite nice, and I see a lot of 'basic qsl' cards in the
managing business. Thus, you can get away a lot cheaper than noted
above if you are willing to live with heavy card stock and one color
ink.

> Any QSL managers out there want to comment?

Being a QSL manager is a lot of fun, but also a lot of pain. If
anyone has any other questions, fire away. Probably the most
important rule is remember that QSL managing is a volunteer effort.

I suspect that one might make a 'little' at it, depending on the DX station...but I doubt it pays for the coffee/beer/soft drinks consumed, let alone the time. I take any money gained and roll it into the dx station in terms of new equipment, etc. As an example, I have furnished a good part of a satellite station in Macau over the last year, buying amplifiers, etc in the used market.

> involved. For one thing, this complicates life for the qsl manager
> so there is a good chance that your request will relegated to the
> bottom of the processing stack. Furthermore, suppose that you work

Good points, Joe. Even more aggravating, not so much to me, but to the ham sending a qsl to a manager, is multiple requests in one SASE for MORE than one station. Then, the dilemna is, do I just send one, or wait until the logs clear for all the qsl cards involved. I usually do the latter, but this sometimes holds a qsl card for a few months. Remember, I wait to receive verification before I send you a card. SOmetimes this is over the air (1 day after receipt of qsl), sometimes via packet, sometimes via mail. Even though I 'keep on hounding' the guys i do cards for, some of them are somewhat slow. Thus, if you have two cards to send to me, and one (or both) are needed for an award and you are hot to get them, invest in two SASES. If I can verify both at the same time, you will get one SASE back unused.

Now that I am done, I will note that some managers REQUIRE a SASE or equivalent per QSL. I don't and I find this practice (of dictating) somewhat offensive, but the realities of life indicate that, if you are in a hurry, send a SASE for each card.

cheers

The atomic clocks are in Boulder, 499 prefix, the antenna farm is on the north end of Fort Collins. I grew up in northern Indiana and would listen to WWV on my dad's shortwave radio. At that time I never dreamed I would some day live out here in Fort Collins. Or maybe I did dream it...

Out here WWV comes in great on shortwave, pretty well on cheap AM radios, and not to badly on a toaster. :-)

As far as telephone "country" codes go, there is not necessarily a one-to-one correspondence between country codes and actual political "countries". You quoted one example of a country with more than one code. The reverse situation also exists, right here in North America -- the US, Canada, Mexico City, and several Caribbean islands all share telephone country code "1".

Radio prefixes may also change as a result of all the unifications going on. But what *I* really want to know is what will happen to representation in the UN after 1992. As far as I'm concerned, after 1992 the entire European Community ought to get only ONE vote in the UN. Or, if they don't like that, we'll give them the alternative of allowing the US *50* votes. After all, Western Europe shouldn't be allowed to have its cake and eat it too.

Can you imagine how different the UN sponsored bodies like the ITU and CCITT would be if this were to happen? We might actually get some reasonable spectrum allocations and telecommunications standards for once. :-)

My favorite ham/license plate/policeman story of all time comes from a high school ham buddy of mine. Some years ago he worked for the Baltimore FCC field office. He had a "company car" sitting in his driveway when I dropped by his place, and I asked to poke around inside. It was a nondescript sedan from which the right front seat had been removed and replaced by a rack of equipment. It contained general coverage HF/VHF/UHF receivers, direction finding equipment, TV demodulators, you name it. Obviously they used it for undercover field enforcement. This was before I bought my R-7000, so the chance to play with a station (mobile, no less) that tuned from DC to daylight was still a novelty to me.

Anyway, as I was twiddling the knobs on the gear I casually asked my friend if the car had US Government plates or ordinary state plates (I hadn't noticed). He replied "Um, I'm not sure. I think state plates." Me: "What do you mean, you're not sure?" "Well, there's a story here I think you'll enjoy."

My friend went on to explain that the car came equipped with a stack of license plates from about 20 states. They would swap them occasionally during an investigation to keep people from getting suspicious (as though a car with a large rack of electronics where the right front seat should be wouldn't be suspicious enough.) Well, it seems that my friend often commuted to work in this car. One day, the state trooper who lived in the next block pulled him over:

"Sir, have you been in Maryland longer than 30 days?"
"Yessir." (My friend has lived in Maryland all his life.)
"Well, sir, if you're going to be in Maryland longer than 30 days, you can't have West Virginia plates on your vehicle."
"OK, no problem. I'll fix it right now"

My friend then gets out of the car, opens the trunk, pulls out a large stack of license plates, pulls out the Pennsylvania plate, and grabs a screwdriver. As he begins to swap the plates, the cop interrupts him.

"Uh, sir, if you're going to be in Maryland, then you need MARYLAND plates!!"
"Oh, why didn't you say so!"

My friend returns to the trunk, pulls out the Maryland set, and returns to work.

"Uh, sir, do you have REGISTRATIONS for all these plates?"
"Sure." My friend pulls out a thick wallet containing 20 fanfolded vehicle registrations, one for each plate. Each is registered to "US GOVERNMENT".
"Uh, sir, JUST WHO ARE YOU ANYWAY?"

My friend finally had to play his hand. He pulled out his FCC identification.

"Sir, if you had only shown that to me at the beginning we could have saved us both a lot of time..."

3092. Any Mods for FT736R?

Newsgroup: rec.ham-radio
Date: 1990-05-25 12:05:06 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <9005260703.AA04833@ucbvax.Berkeley.EDU>
Source record: 11394

Thanks a million to Erik Sorgatz for his out-of-band RX
mod for the FT736. This is the first mod I have ever heard
of for this rig. I guess its complexity is not conducive to
tinkering...

One small correction, though: there is indeed a 220 MHz module for
the '736. I have one, and it works fine. Got it from
the dealer when I bought the rig.

Now, if someone could just find a way to get the '736 to
scan with the squelch open, then we'd be making some progress.

Other suggested mods, if anyone feels up to the challenge:
1. A=B VFO jumping
2. Set-and-forget RIT (RIT stays on while you tune around, for EME)
3. 25 watts out on 6 meters (to adequately drive a 3CX800)
4. Tunable memories

Thanks again to Mr. Sorgatz!

This is NOT meant to flame Steve. I greatly appreciate the efforts of QSL managers. However, some would appear to make more than a 'little' at it. These people tend to tick me off a bit. I recently had the ocassion to work some stations who have OH2BN for a QSL manager (he seems to be a popular manager). As usual, I sent my card with a green stamp for each contact as they were worked at different times. I have received one card back. Guess what? It was mailed from California with a 25-cent stamp. Say he handles QSLs for a dxpedition and gets 1,000 cards from U.S. hams with a green stamp. He spends $250.00 for stamps and keeps $750.00. This is more than a making a little money. I have had this happen a very few times over the past 13 years. Most QSL managers do not do this.

If QSLs are to be mailed back from the U.S., the QSL information should include the fact that an sase should be sent with the card. I have no problem with honesty, but do have a problem with deception! It is good that this type of QSL managing is the exception to the rule.

Most QSL managers deserve a large pat on the back for their efforts. Without them DXing would not be very worthwhile.

Maybe California should emulate Texas and identify the license plates as "radio operator" right on the plates themselves. This eliminates the problem of the cop cadets who sleep through license plate identification class.

Actually, incentive licensing became reality in November, 1967. Prior to that, full privileges were conveyed by the General/Conditional Classes. (Does anyone recall the Conditional Class? It was equivalent to a General-Class license, but it was taken by mail. It was available to those who were physically unable by virtue of disability or distance to present themselves at a place where the FCC held amateur exams at least quarterly). The Amateur Extra Class conveyed no special privileges, only a warm, fuzzy feeling and a blue-and-white diploma-like sheepskin (suitable for framing) that resembled the diplomas the FCC gave for Commercial Radiotelephone/Radiotelegraph licenses. At the time the FCC adopted incentive licensing (late summer of 1967), there were about 5,000 Extra Class licensees out of an amateur population of some 250,000. Please don't hold me to that statistic, though; memories THAT old rely on residual magnetization of the old cores :-) :-)

The old Class A was rejuvenated and re-named "Advanced Class" in November, 1967; I recall going to Chicago just after Christmas of 1967 to take the Advanced exam, just a month after the class was re-opened. The first restriction of privileges to persons other than Extra Class licensees took place in November, 1968; the second restriction, which established the subbands in largely the form in which they exist today, took place in November, 1969.

My privileges were restricted for a while, because I could not take the Extra Class exam until August, 1969. At that time, an applicant (or was the correct term "supplicant?") for the Extra Class had to have accumulated two years as a licensee of the General Class or higher.

Anyone else recall those old Extra Class diplomas?

3097. Getting the back off a Sony 2002/7600D

Newsgroup: rec.ham-radio
Date: 1990-05-25 14:11:46 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <9005262014.AA09282@ucbvax.Berkeley.EDU>
Source record: 11398

Over on the SWL group, a person posted a request for the trick of getting the back off a Sony ICF-2002/7600D radio.

I distinctly recall reading a network posting many moons ago (maybe 2 years? maybe mere?) on the ham group/list (before the SWL list existed) where the trick of dissassembling the 2002/7600D was described. I also remember carefully saving the info because I have a 7600D and might need the data sometime. Now I cannot locate it!

AAAAARRGHH!

One of those days... :-)

If the person who posted that info is still around, could you mail me the instructions, or post them? Or if anyone else out there saved the info and is better organized than I and can find it, please send me a copy. Thanks much!

Regards, Will

3098. Retransmission of SAREX communications

Newsgroup: rec.ham-radio
Date: 1990-05-25 14:59:11 UTC
From: jrm@sage0.gsfc.nasa.gov
Message-ID: <2161@dftsrv.gsfc.nasa.gov>
Source record: 11426

During the STS-35 SAREX mission, AMSAT will provide a network to link
US classrooms through local repeaters to a amateur ground station
in contact with ham astronaut Ron Parise.

WA3NAN at Goddard Space Flight Center hopes to retransmit the SAREX
communications - interrupting the NASCOM shuttle communications
retransmission for the duration of the SAREX communications.
However this will require that a phone patch operate at our station with a
kilowatt of power on four different HF bands. Installation and testing
are in progress.

> I am waiting for the poor soul who gets NH5HHH :)

A few years ago when I was in the Rio Grande Valley I heard the "CW call from hell" on one of the two meter repeaters: WS5H. Getting a call like this is one of the reasons I never opted to enter the FCC Random 2x1 Callsign Sweepstakes.

In retrospect, the likelyhood of getting a *really* bad call was quite small. I just didn't understand how to play the game. Not too many calls are ever issued in a given day (or week) for a particular call area. If you pick a prefix you like (such as KM5, or whatever), you could get it with proper timing. Personally, I would avoid the letters in the beginning of the alphabet (dit-intensive letters like H and I and B don't tickle me). Given such, I could pretty much accept anything in the M-Z range, although I'm not crazy about S and V. So be it.

Call the FCC and ask what the "next" callsign is in your block. Once they get up to the right spot (say KM5M), then Fed-Ex your 610 to Gettysburg. Unfortunately, the were in the AA5xx calls by the time I got comfortable with this idea and I am having trouble getting excited by the thought of becoming a yay-yay-five. Sigh.

Maybe another PRB-3 or whatever will come along someday.

An interesting report, Erik. But are you describing the ft736 or the ft726
or what? My ft736 covers 430-450 with one module, and I am sure the 220
module is available. The ft736 comes with 2m & 70cm; you can add 2 more
band units, choosing from 6m, 220Mhz, and 1.2GHz.

From: kenw@col.hp.com
Message-ID: <24300011@col.hp.com>
Source record: 11412

I suspect that what you heard was an image frequency. Most news media (on the UHF band) is situated from 450 to 451 MHz. Try looking up the IF (intermediate frequency) of the UHF receiver portion of your scanner, multiply by 2 and add it to 407.750. See if the real channel is not 450.xxx. In order to obtain the wide tuning ranges, most scanners do not have tuned "front ends", thus are susceptible to images; a frustrating, but common, problem.

In article <5274@hub.ucsb.edu> 6600dong@ucsbuxa.ucsb.edu (Dong Hwan Kim) writes:
>I do now know much about Ham-Radio and I just want to know how I can communicate with my friend in korea thru ham-radio.
>Is the novice license enough for me to talk to me friend in Korea?
>Do I need to buy a very good radio since Korea is so far from USA?

Dong Hwan Kim:

It is absolutely possible to communicate with your friends in Korea using ham radio. It will not be completely reliable, and you will have to choose your time of day carefully, but you can probably have good communications with Korea several times a week. You raise several points, which I'll answer in turn:
a. A novice license is absolutely adequate, but you will have to do your communications using the international morse code. A novice license will allow you to communicate in the band 7.100 MHz - 7.150 MHz (among others), and it is on the 7 MHz band that I hear the Koreans most frequently. It is almost always possible to hear Korea from California just about sunrise each morning. You have to search hard to find them, because there are many Japanese stations active on 7 MHz at that time of day, and some of them are quite strong. But the Koreans are in there! A novice license will also allow you to transmit using voice in the range of 28.300 MHz - 28.5 MHz, but long-distance communications in that frequency range is highly unpredictable. It is only good during the daytime, and there needs to be a high level of ionization in the upper atmosphere in order for the signals to refract back to earth rather than escape into space.
b. You will not need a particularly expensive radio to reach Korea. You should expect to pay maybe $1000, somewhat less used. What will be more important than the radio will be the antenna you use. It will probably be a wire stretched horizontally (roughly 66' long, and it needs to be up as high as you can get it, and in no case less than about 45' from the ground), or a vertical aluminum tube about 33' long. Either can be made from inexpensive materials from a local hardware store.
Good luck!

3106. Uniden HR-2600 Mods wanted

Source record: 11406

I would like to make a few mods to a Uniden Hr-2600 10m all mode radio mainly in connection with is use as an IF for transverters to 144 MHz and the higher bands. I would like to reduce the output power to a sub 100mW level to save having to use a high power attenuator and to conserve battery power (/P operation). It would also be nice to change the 5kHz scanning step size to 1kHz and to extend the frequency coverage to 28-30 MHz. Before I go digging into the radio with a soldering iron, has anyone done these mods or can anyone direct me to a source of such information?

Tnx in advance, 73 Bob Atkins KA1GT

3108. The PRO 2006!!!! In GROVES Catalogue ++ CONSPIRACY THEORY

Newsgroup: rec.ham-radio
Date: 1990-05-25 18:00:56 UTC
From: flash@lopez.UUCP
Message-ID: <1990May25.180056.1974@lopez.UUCP>
Source record: 11405
Cross-posted to: rec.radio.shortwave,rec.ham-radio

I have not seen any one else post this, but I am sure by the time you see this, someone else might, but JUST IN CASE:

Page 23 of the latest BOB GROVE mailing says:

The Realistic Pro-2006

The most popular high performance scanner ever is even better

COMING SOON!

Well leave it to old Bob G to know more than the boys at the local RS (Radio Slouch) store!

What does it LOOK LIKE? Gosh, I said to myself. Looks exactly like my 2005. Well sure enough, Bob (Master of Hype, creator of the soon to be delivered SR-1000 with the FAKE mock up picture in every catalogue [I have DONE fake MOCKUPS I know what to look for, can you say VAPORWARE, I KNEW YOU COULD]) the picture in the 2006 ad is really a 2005. The photo is underexposed to make the scanner at first glance seem new because it is not the light grey, but a much darker hue.

RAPID 26 channels per second search. He does not mention the metal case.

Correct me if I am wrong, but can't you just clip a diode to get this feature?

NOW HERE is where I have the WB8EOH Theory of the RS SCANNER DIODES CONSPIRACY. Read closely folks, I think I am on to something.

Let us suppose that you were a marketing genius. Let us say, you wanted to OWN the scanner market for the next 5 years. What would YOU do. Now if I were in that position, here would be my plan (Let us assume that I am also greedy, and slightly devious)

I would have my people in Japan design a scanner so advanced it would blow everything else on the market out of the water ten times over.

Then I would order a billion circuit boards, but in the design I would do this.

I would set it up so that instead of selling this remarkable scanner outright, I would add DIODES to it that would CUT BACK on the performance.

One diode to CUT BACK the number of channels from the 400 that was designed into it, back to 300. One diode to SLOW DOWN the scanning

rate. One diode to DELETE a band of frequencies, and so on.

So I would release the FIRST version of the scanner, and everyone would say: WOW a 300 channel scanner, wow!

I would sell that scanner for a couple years, then I would retool the case, but keep the same circuit. ONLY I would instruct the people doing the wiring to omit the diode that keeps it a 300 channel scanner, so I could sell my NEW 400 CHANNEL SCANNER!!!!

I would sell that one for a year, and then I would blow it out at a cut price, and introduce my NEXT version of the circuit board, and instruct my guys to LEAVE OUT the diode that cuts the scan rate down, so I could say "NOW A REMARKABLE 26 channels a SECOND"

Now if the WB8EOH theory holds, here is what happens next:

I would sell this new scanner for a year or two, waiting for a test case of ECPA, which will certainly get that silly law repealed, and then instruct my boys to build them without that last diode. Then I would blow out the 2006 at a rediculous low price and tell Bob Grove he could be the first to print:

THE BEST IS EVEN BETTER!!!!! NEW PRO 2007 NOW INCLUDES CELULAR!!!!!

The only fly in the ointment would be if some scanner underground had the original 300 channel pro 2003's and found out that by clipping the diodes themselves they could upgrade their OLD scanner to the one I would be selling in FIVE years, and they would not spend the $419 on the SAME scanner every one or two years.

That's what I would do if I were a savvy marketing expert wanting to corner the entire scanner market for myself.....

Sounds like science fiction huh. I shoulda cross posted to alt.conspiracy.

Comments??????

I've had an interesting ambiguity problem of late, too. W6ZH is
also an active DXer (Pete Hoover) and he and I have been in the
pileups together a few times.

And now KI6ZH has burst on the DX scene, and he's also in San
Diego. The three of us get a few of each other's QSLs, especially
thru the buro. But we've all had a problem with trying to
convince some DX stations that it was the OTHER 6ZH who was in the
log a few minutes ago!

One thing that has always eluded my old monitoring ears has been REAL communications satellites. The good stuff like FLTSATCOM, etc. I have talked to people who have heard such things on their REAL communications receivers (R-7000, etc), but nothing here has ever showed up.

Yeah, I know, Sow's Ear != Silk Purse The 2005 is a nifty highly advanced scanner, but does not have fine tuning capabilities, etc. And it is not overly sensitive compared to an ICOM R-7000. It does what it does very well.

I have heard some of the WHEEDLE WHEEDLE sats, but I want to hear voice coms. One guy I was talking to on 20m once told me about hearing satellite relays of riverboat traffic.

Now I do have a fairly good antenna (CHANNELMASTER 5094) BUT it does not have any gain in the region (200mhz-300mhz) where I have heard some of these birds live.

I am wondering if someone out there in netland has bagged a real voice com sat on the 2005, and if so using what antenna, and what freq, and what quality signal.

This sounds like a nifty hobby, satlistening, but before I go drop a bundle of bucks on an R-7000, I would like to know what is there, and if I can at least get a hint with the 2005.

I will understand if the answer is: GET A REAL RADIO, KID...

Ah, dem numbers how I loves 'em. In fact, I have only
heard a few. But then, I haven't been on the air long enough in the
past years -- my wife yupped out on me and I had to take the station
out of the living room -- so if them number stations is still around,
I'm not surprised.
But, judging from what I've heard and read, I firmly believe that
they are conspiracy con to try and dupe the true believers in the
One Trualesman into thinkng that there really is a con from somehwere
else! Gawlee, do I love that.
Those sullen sobs out there with their AR17 and AK47 -- most of 'em in
the oil soaked hills of Montana (Hi, Liz. How's the Crutch United and
Flatulent?) are dead serios. They want you to be dead serious too. Most
of all they want you dead. So, do, indeed, be careful around 'em.
Which makes me wonder if they might not have something to do with Olie
the Colonel and his gang of badgers. How many hostages have the numbers
stations caused? Will we ever know? Given the climate of the media, will
we ever want to know?
Only "Bob" Dobbs knows for sure, and he ain't talking.

> 407.750 MHz as studio-to-remote director's link.

I've never visited Texas, but in northern Illinois, this is what folks hear on that frequency:

407.7500 call?_____US: Postal Svc, DVP scrambling, f3, input to 415.050 [Chicago] (others)

Two years ago, I found a similar signal on my R-7000 and BC-300.

A remote broadcast link transmitter was wandering several megahertz up through the 462 MHz GMRS range and beyond. I traced it to a spur in the WSPY remote transmitter being used to broadcast the local high school football game. I called the station and argued with the non-technical guy at the studio for 30 minutes.

[The only way I convinced him it was his equipment problem and get him off the phone was to tell him
1) I work at Bell Labs (big deal, eh?)
2) My pizza was getting cold.]

He finally admitted that the remote transmitter had a history of these problems and they never used a spectrum analyzer to check the spectral purity of the signal. The remote's signal sounded fine on its assigned fundamental frequency, but the phantom spur had muddy modulation and wandered around the UHF spectrum like it had a mind of its own.

Robert Casey (rfc@briar.Philips.com (Robert Casey)) mentions commercial radio call sign "NERD" and wondered if there were a "N3RD". How about a new "B" prefix? It would be great for one of our private pilots... it could be "B1RD".

Found the following description of the operation of an amplified FM broadcast antenna: "It hunts the airwaves for hidden and weak signals and pulls them in like a radio magnet."
"Once it locks on to a signal, a Gallium Arsenide Field Effect Transistor (GaAsFET) inside the antenna traps noise and static-hiss and literally obliterates it."

Kind of a strange way to describe a pre-amp. Wouldn't think that a pre-amp would "trap" noise!

One night last summer, a friend of mine and I were out performing car acrobatics. I ended up with a tailpipe stuffed with a few inches of hard-packed dirt (DON'T ASK!!)

Digging it out with a key was a long, slow process and it was getting nowhere fast. We decided to make our way to a wild party we could see from the street. A few girls were yelling at us from there. So, we drove over to the apartment and knocked on the door several times to ask for a butter knife. (Pretty unusual request, eh?)

The door was answered by a few drunk types who weren't very happy to be disturbed. Of course, they were not to be reasoned with. They began to get somewhat unruly and started speaking about violence (not realizing that my friend was a student of the martial arts). I very casually walked over to my car and keyed up on 147.14 and listened to good ol' WB5KFJ the talking repeater with the volume up loud.

The drunks practically came unglued! There were several minors at this party and they thought we were cops!! Things settled down VERY quickly, and we left without further incident. Ham radio saved the day!

So... let's hear your stories about how you were rescued from various real and not-so-real emergencies thanks to the radio. I carrry my HT with me EVERYWHERE I go, and people give me a hard time about it. But I know that it will come in very handy someday when there is some form of accident or other incident that precludes my getting to a telephone.

I KNOW this will make for some interesting reading!

Was thinking back when (summer of 76) I took my Tech test at the FCC office in NYC. If I remember correctly, the code test was easy, and I probably got most all of it correct. I did worse on the theory and rules part. Almost failed it, the FCC person said I got the minimun +1 correct. Maybe the person who assigned the calls saw the test results, and figured I'd be a CW fan, and gave me WA2ISE .. ... . from what they had on the list that week?
Turns out that I don't like code much!

I've been using the GMS-403 Nicad battery charger from Control Products
Unlimited 215-383-6395 to charge ALL of my nicad batteries. I have
program modules to charge my lap-top computer battery, electric
screwdriver, radio batteries, ... ect... I have been able
to recover several packs that had developed 'memory' and I thought
were lost by using the chargers memory erase feature. The 470
pack is charged in about an hour, typically. Give CPU a call and
request a brochure.

I heard a similar story recently at a talk given by an FCC employee who used to do location work. In his case, he was waved over by a NY state (I think it was) inspection unit that checks the validity of safety inspection stickers. The trouble was that the "company car" was wearing NY plates but they had forgotten to put the inspection sticker on the windshield. (Apparently they are stocked with the appropriate stickers as well as license plates.) The fellow looked in the glove box--no stickers left. So, while he was waiting in the line of cars at the inspection point, he casually got out of the car, went to the back, opened the trunk and changed to another state's plate. When he got to the front of the line, the cop looked at his plate, shook his head in disgust and waved him on!

Lest anyone get confused by the similar numbers: the 7600DS is a
different radio from the new 7600 (no suffix). The 7600, which
replaces the 2002/3, is compatible with stereo phones -- no adaptor
needed.

Last time I got the tour, there were clocks at both places.
I remember the number in Ft. Collins as 3.

They compared the two sets by looking at a TV station
equaldistant from both places, and relating time to the sync
signal or such. THAT struck me as a bit of lash-up, but they
were happy with it.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

That's funny. I wouldn't expect that most hams would know that IP stands for "Internet Protocol", in NY or anywhere else!

>it could be "B1RD".

There was an article in one of the aviation magazines a few months ago
that featured a family named Bird; all of their aircraft were registered
as Nx81RD. One of their helicopters even had the 8 modified to look more
like a B.

Years ago you could request a "custom" call for $20.00. I think you
had to be General class or higher to do this.

For a period in the 1970s if you upgraded to Extra, you could choose
a 2 letter suffix of a 1x2 call to your liking. My pal K7JCA chose
K7SS, because it was snappy in contests (especially ARRL Sweepstakes).

3133. Stealth Paint Needed

Newsgroup: rec.ham-radio
Date: 1990-05-27 15:53:49 UTC
From: john@anasaz.UUCP
Message-ID: <2341@anasaz.UUCP>
Source record: 11338
Cross-posted to: rec.ham-radio,sci.electronics

I would like to paint my HF beam with some camo-colors so as to reduce its visual impact. I tried this once before with a 2-meter beam, and the effect was stunning - the antenna just disappeared. I should mention that the only angles at which it was visible in the first place were from a long distance, horizontal, with mountain/ folliage backdrop.

The problem is that the paint apparently had a significant dielectric effect, screwing up the antenna. I certainly don't want to mess up my HF beam!

Does anyone KNOW where to get paint with minimal effect, that can be applied directly to aluminum radiating surfaces? Does anyone know what this stuff is called, or specific brands?

If anyone knows of mods to the Radio Shack Pro-38, would you please mail them to me? This might even be of general interest, since I could not find them on the hamster archive. I'm particularly interested in adding 800 Mhz coverage, adding 66-88 Mhz, and expanding the channel memory. Responses which say ``you can't do that'' are also welcome.

Thanks.

I met a fellow recently who carries his HT with him on his belt loop like
an official looking person. Both he and his wife have tickets, so when
he is out and about town he can contact her via a local repeater. So
his HT is basically a cellular phone! (Actually more truth to that since
the repeater he hits has an autopatch).

If you can not detune Apple II's clock oscillator (because of NTSC monitor), try putting FR chokes to all leads coming out of the Apple II main unit. There are quite good two part put together chokes made by Amidon Associates, Inc in the USA. Using these there is no need to remove any connectors or cut cables. Put whole cables thru chokes as near as possible to the Apple II main unit. Ask help from a radio amateur or look up some book on RFI.

Given current ITU/ICAO callsign block assignments, yes. The only shorter ham call would be E5E, and there's no current assignment for the E5A-E5Z block.
I don't know if the Italians would assign it, though.

> And 0Q0QJY the longest?

Again, assuming current callsign block assignments, this one's not valid. I don't believe 1AA-1ZZ is assigned, either, so that makes the longest calls [JY]00[JQY][JQY][JQY]. I think Y0A-Y0Z is assigned to the DDR (for now), but can't guess about J0A-J0Z.

Message-ID: <683.2661E6C2@weyr.FIDONET.ORG>
Source record: 11349

How was your WPX CW Contest? At this location things were lousy. It seemed as though I was in a BLACK HOLE. About 2050Z on saturday there
was a complete blackout of everything from DC to light. For about 45 mins WWV on all frequencies was completely wiped out. There was not
a single amateur station to be heard on 14/21/28. During the whole
time of the contest I worked every european station I heard - six
stations - 2 DJ's, 1 G, 2 YU's and 1 Y41. Not a single OK/LA/ON/OH,
etc was heard. Even more dissappointing not a single JA was heard.
The contest at this location (which is about 300 miles north of the
North Dakota - Sask border) was very, very bad. Just for the fun of
it I tried to work as many state side and SA stations as I could.
My approx 20 hours of effort yielded 245 QSO's - I can normally do that
on a good sunday afternoon. Did any of the rest of you experience
a similar WPX contest?

> This is NOT meant to flame Steve. I greatly appreciate the efforts of
(WHEW!)

Thanks for the pat on the back John! You bring up a good point.
However, this happens quite often. For example, some guys do this,
who manage their own qsl cards, to 'fund their dx-peditions. While
I don't know this for sure, i believe ZL1AMO does this, as each card
I have sent him comes back with a us stamp. Worse than this, is the
F6 manager who requires 2 bucks for airmail reply. send one buck,
and it comes back via the buro, send a sase, and it gets trashed. I
believe this is what is happening, and has been written up in many
dx magazines. Some awards will no longer accept his qsls any more!

I guess it would be interesting to find out what happens to
the 'difference' between the money you send and the us stamp that is
used. If it goes for a 'good purpose', i.e, other than lining ones
wallet, then I suspect that, if the delay incurred in making this
happen is insignificant, maybe it is ok. I know that, for a dx
station to get a card from me, two ircs are worth 80 cents at the
post office, and 1.00 in the ham market. the stamp is 45 cents for
return air mail, and the card ranges from 2-4 cents. If
a 'donation' is included (i.e., more than 2 ircs, etc..) i usually
include a note and a picture of the ham, or some such thing. I keep
pretty accurate records, which is easy once you organized to do it
(which is a must for QSL managing!).....and as I mention before, use
it to help the dx ham out. For the garden variety dx i manage,
i.e., 8p6 and ti, i run in the red.....as some stations do not even
include sases. For the xx9 stations i manage, they generate money
in the 100's of dollars when active. thus....purchases of
significant equipment are possible. You can argue whether this is
the 'best, or appropriate' use of the money, but it seems that any
other use would come under more fire!

cheers, and thanks for the kind words for QSL managers in
general..for the most part, they are a GREAT group of people.
Consider the XX9 station i manage for, before me, hadn't answered a
QSL in 3 years! I carried over 7000 qsl cards back from my first
trip there...

> Just for pedantry, the angle is not normally the phase angle of the
> carrier relative to some absolute phase reference, but the phase shift
> between the previous symbol and the current one. That way the
> modulation scheme is self-clocking.

If the data is scrambled properly, it is virtually assured of self clocking. It really does not matter if you rotate your relative angle each time you transmit a symbol; there is still a chance that some data will lose clocking on you. In the unscrambled case, consider 0000 in both absolute and relative angle systems. If not 0000, then whichever symbol will result in no angle change. With scrambling, though, it probably does not matter.

> Also, the 4x4 grid isn't quite square; it's more of a pincushion.

I would guess an array of points in a hexagonal arrangement would be ideal, but the circuitry would be more complex. Think of the problem as packing a number (in this case specifically 16) small circles in a larger one. Add to that the mathematical formula for deriving the circle id from a coordinate in the larger circle needs to be as simple as possible.

When I played with the FT-736 at Dayton 1.1 years ago, it tuned through the 220-225 Mhz band just fine. Kenwood and Icom didn't see fit to consider the non-Oscar VHF DX-er.

> gots'ta know....See ya on DaveTV (427.25, 439.25)

They are also mentioned all over the place in (as far as I can tell) every radio service. So far I have not found the actual definition of damped waves, but I'm guessing it is spark-gap. The "damping" is the filtering used to select a frequency of a broad nature. I supposed if this is the case, one could argue that the non-coherent radiation from an incandescent light bulb through a narrowband Wratten* or dichroic filter would be prohibited by this.

[*Wratten is a trade-mark of Eastman Kodak]

In an earlier posting, I suggested Charlie heard a spur rather than an
image. An image seemed unlikely given that the BC-210, R-7000, and
MX4000 have different IF frequencies.

Perhaps Charlie could reiterate whether he heard the signal on
all three receivers.

I have a Ford Aerostar that had exactly the same problem. What I did
was use a 1/2 wave glass mount antenna. The Aerostar has small triangular
windows between the doors and the windshield. These are windows are low
(and thin). I mounted the antenna on the drivers side window. Now, this
installation isn't optimal. The antenna runs very close to the door pillar
and protrudes only a few inches above the roof line. Also, I can't run more
than 15W without affecting the electronic instruments (which aren't far
away). All things considered, it works pretty well.

```
-------
Well, two unusual occurances in San Diego yesterday--it rained
almost an inch (probably hasn't rained in Southern Calif. on
Memorial Day for 50 years) AND the TV was hopping with E-skip all
day long! The 6-meter guys were going nutz with working rare grid
squares, too.

Over the course of the day I logged:

KUSD 2 Vermillion, S.D.
KXMA 2 Dickinson, N.D.
KMID 2 Midland, TX
KTWO 2 Casper, WY
KBTX 3 Bryan, TX
KSNW 3 Wichita, KS
KENM 3 Portales, NM
"Prairie Public TV" on channel 3--don't know where.

And there was lots of other stuff, too, incl. channels 4 and 5.
But I couldn't stay glued to the TV all day!

Anyone else have some VHF fun yesterday?

--Jim, K6ZH

Our local 2m repeater used to be housed in the elevator-machinery room
of a building on the local university campus. The door to the room
was at the top of a stairway that went nowhere else except a locked
roof door.

One early Sunday morning, a ham went to the repeater site to make
minor repairs. He carried his h-t on his belt. When he arrived at
the machine-room door, he surprised two students smoking dope.

"You're a plainclothesman, aren't you?" one of them asked.

"Well, yeah, I've got my plain clothes on."

"Will this be alright?" asked the doper, handing him a $20 bill.

"Sure. You boys be careful, now," he said as they departed.

That's a common misconception. Scrambling has no effect on whether
a code is self-clocking. All it does is change WHICH user data pattern
causes absence of clocking.

Unfortunately this mistake is common in certain parts of the communication
industry. The reality is that the ONLY way to have guaranteed clocking is
to use a code that has minimum transition density guarantees. For example,
FDDI is self-clocking; SONET is not.

I ordered a Heathkit TNC in early April and today the order was returned with the announcement that all Heath Canada stores except Mississauga are closed and Mississauga is gone by July. I was referred to Benton Harbour.

Apparantly Heath Canada was not unsuccessful but is more a victem of the new Corporate masters. Something like Studabaker.

Is this the beginning of a trend? Is Heathkit marked for execution? I know that Heath is no longer the major force that they were in the fifties through early seventies but I would still miss them.

The homogenization of planet earth.

Last summer, I drove from California to eastern North Dakota. While passing through Bozeman, Montana, I decided to fire up my 2m handheld, and see if I could get into the Bozeman 2m machine. So, with a QSO in progress, I look in my rear - view mirror, to see a Montana HP car with his lights on. Having been through the routine before (owning a performance car has its problems), I pulled over, and reached for the registration stuff. I noticed that the officer wasn't carrying anything, so maybe I was going to get off with a warning. Down goes the window...

"Hi Officer. What can I do for you?"

"Could I borrow your radio?"

(Shock, relief, puzzlement...)

"Are you a ham?"

"Yep"

"What's your call?"

"N7..."

So, I hand him the HT. He brings up the patch on the repeater, calls his wife, tells her he's going to be a few hours late because someone didn't show for his shift, hands me back the radio, and says thanks, and starts walking away. He then turns around, and says:

"Oh, by the way, you really should get ham license plates. We generally don't pull over hams unless they do something really stupid."

Yep, needless to say, I now have ham plates.

I was walking along a busy street one afternoon when two cars hit nearly head-on. I whipped my 2m HT from my belt and walked out into the street to get a better look at one driver, who was dazed and bleeding, but apparently not seriously hurt. I autodialed 911 and had the report in within 20 seconds or so.

While I was in the street my wife overheard a bystander say "He must be a cop or something."

The funny part was that a paramedic ambulance, probably just leaving Cedars-Sinai emergency (half a block away), happened upon the scene almost immediately. The whole thing took less than a minute. By then, I was no longer a cop, but somebody *really* important, because when *I* called, they got there in a hurry!

David A Rasmussen writes:

>I turned on my kenwood Th215 the other day and got no audio from the speaker.
>The earphone jack still works but I hadn't used that before the speaker died.
>Is this anything for someone whose electronics experience has been limited to
>soldering heathkit terminals together to look at, or is this a job for the
>folks at amateur electronic supply?

David, I had the *exact* same problem with my brand new TH215A. I think I bought the thing about 2 years ago and when I received the radio, it was in perfect working order. About 5 days later, the speaker just cut out on me. There was still audio coming out of the speaker jack however. The remedy to this problem was to order a new speaker from Kenwood. The speakers have these hair-thin wires that tend to break very easily and I suspect that this is what happened to you. It is fairly simple to replace the speaker. Simply take the cover off of the 215, desolder and pry the speaker out of the front panel. Resolder and replace with a new speaker from Kenwood. You will want to apply some kind of adhesive to the edge of the speaker to firmly secure it back in place. It should only take you less then 10 minutes... The phone number for the Kenwood parts dept. is (213) 639-9000.

3165. network analyzers

Newsgroup: rec.ham-radio
Date: 1990-05-29 18:11:00 UTC
From: UCSBPM@UWPLATT.EDU
Message-ID: <899259EA97FF203FB1@uwplatt.edu>
Source record: 11371

A while ago someone posted plans for a 2-meter J-pole. Then some
one said "use a network analyzer to find the 50 ohm point"
to which someone else replied "Ya, like we have one, dream on, dude"

Well, it just so happens I have one, well, ahave acess to one. Here
at UW-Platteville, we have TWO HP 3577A (5Hz-200MHz) network analyzers
(while I'm bragging, let me empisize that UWP is only one of 4 or 5
universities that has these for undergrad use, and i think the only
one that has 2 and lets sophmores at them, also, UWP graduated
approx 30 EE's this may)

(brag mode off)

We also have an s-parameter test set along with 50.000 ohm resistors
How do I use a network analyzer to find the 50 ohm point? I'm familiar
with smith charts and the general operation of the machine, but since
I'm a digital emphisis, I don't really have experience with doing
this sort of thing. Could someone e-mail me some hints?
Something like "probe along until 146 MHZ crossess the r=50 ohm
circle" would be great.

Thanks in advance,

One thing that you all haven't yet considered is that it was the second harmonic of the remote microphones that are used for studio work. Not having the exact channel frequencies before me, the remote mike stuff can occupy many spectrum within many different VHF TV channels, especially around 200 - 215 MHz. Sorry I can't be more exact...

I recently repaired a President model 2510 radio and promptly fell in love
with it. Even though it is not the greatest 10 meter radio, it is a damn
good one, and I have had some remarkable dx's with it. I am now in the process
of buying one, and i need to know all the modifications that can be done to it.
These are the ones I know of, the 11-meter conversion, and the power pod.
But i have just heard of these. If anyone could send me any information that
they have i will try to post a modification on how to convert it to 100 watts
am and 250 peak sideband.
please email any information, and if neccessary i will cover any postage for
schemeatics.
i have heard that some of the mods were in mags like 73, so if you could at
least send the issue number.
many thanks and 73's\

I became a HAM last year. About 6 weeks after I got my license it paid
for itself. A group of college age kids from our church went North here
in Michigan to do some water skiing. One of the kids who went along has
had medical problems (Epilepsy) but hadn't had a fit for about 5 years. He
came along and was enjoying the day. After getting done skiing he
was lying on a towel and went into a fit. There were no telephones for quite
a ways (2-3 miles) from the place we were skiing. This would have been a long
run. I called out on the local repeater frequency (I didn't know how to use
it's autopatch -- or if they had 911). A local ham called the ambulance and
it arrived it <5 minutes. Definitely saved the day and helped our friend
out.

Frankly, this one incident was enough to make getting my license worthwhile.

I tried mail, but it bounced. The answer is probably of general enough interest. The U.K. recip licence costs 12 pounds Sterling, and is good for 2 months if mobile, 1 year if you supply a U.K. station address. Third-party traffic is prohibited.

Since David just passed his exams, there may be bad news -- you have to be General or above for the reciprocal priviliges. A Technician license isn't good enough.

> to do with sitting smack-dab in the middle of the Laurentian
> Shield!
> - jon NW6H

For some reason every time there is a DX contest the E/H wave eaters
show up. Some time the geo-magnetic conditions get so bad that I can't
even hear myself think --- Now that's real bad. I know that others
live in QTH's which have the same difficulty. That is why I asked about some ideas on a
FAIR INTERNATIONAL DX CONTEST which would
account for band conditions as well as the station ERP. I guess
I could move but then who would be here to give all you guys the
VE5 prefix for the SS/Sprint/WPX contest. Oh well I guess no matter
how much I spend on rigs/towers/antennae the protons/electrtons
which swirl around up here are going to win any way!
See you all in the next contest .... provided the God's are in a good
mood.
PS. I am moving my QTH in the fall to the south of England. I am
going to take a QRP rig with me but I expect that I will only have
some bedsprings for an antenna. At least I will be able to experience
conditions from another QTH.

> that this type of QSL managing is the exception to the rule.

I don't agree with this sentiment. I don't see this as a deception; I see it as economy. When I send cards to a manager overseas I include: QSL cards (average of two or three), compensation (a green stamp or two IRCs; IRCs can be had for $0.40 on the secondary market) and a return envelope. I try to view this as a fixed expense for getting cards from overseas. Want a card? Send a buck.

What's wrong with making those incoming dollars go a little further? They can be used to buy QSLs, or reply to bureau cards. (QSLing via the bureau is not gratis in every country like it is here .. and face it, $2 per pound of outgoing approximates free.) The money can be used to pay DXpedition bills. What's wrong with spending your money wisely?

For example, if it cost approx. $US 0.80 to send cards from Finland, but only approx. $US 0.60 to send them from Sweden, would you be irate if they drove over to Sweden and sent the cards? I wouldn't.

Where I draw the line is when DXpeditioners expect me to foot the cost of their DXpedition. I don't go for the "I'm doing you a favour by going on a DXpeditions so you can work a new country. You owe it to me to help pay the bills." Bzzzzzt. WRONG. You're going on DXpeditions because you derive personal satisfaction from this kind of activity (in the form of recognition from your peers, you enjoy travelling, you enjoy the challenge, whatever).

I used clear Krylon at one time and discovered that it came apart
pretty badly after a little while, presumably due to UV exposure but
I never proved that was the cause.
I've been building and measuring vhf/uhf antennas for quite a while
and I often use brazing rod for elements and copper water pipes for the boom.
One of the subtle problems that can occur with such construction is
due to corrosion, oxides sulfides and I don't know what all, building
up on the elements if they are not protected. This has the insidious
effect of reducing antenna efficiency without showing up in the pattern.
Essentially the gain drops on both transmit and receive and unless you
have a known good reference antenna you may not even notice it!
(It's a little like the budget deficit (:>) Everything appears to be
"normal".

I have had good results with standard spray paints. I don't remember
the brands, but I've seen no problem as far as changes in feedpoint impedance
before and after spray painting, I've measured quite a number using a
vector network analyzer. The finished (painted)antennas have appeared to
have the correct gains for their number of elements/boomlength.
I can't say that I ever tried camoflouge paint but I don't expect that
would fool the electrons (:>).

I can't think of any cases in which having a radio has gotten me out of a real jam (except for the one time I ran out of gas), but I *can* cite one case in which it almost got me INTO a serious jam.

It was about 9 years ago, just after a USENIX conference. I was taking the San Francisco BART across the bay to visit a friend at UC Berkeley. I had all my luggage with me, and my 2m HT was sticking out of my coat pocket. As I gazed out the window at nothing in particular, I noticed from the reflection in the window that the guy sitting on the other side of the car was counting out pills into the palm of a young girl's hand. This surprised me, and before my better judgement could prevail I reflexively turned my head and looked directly at the guy to see if I saw what I thought I saw.

Yes, this was indeed a mistake. He saw the radio and antenna sticking out of my pocket and apparently took me for some sort of narc or cop: "Hey, what YOU looking at?" All I could do was to turn back to the window and ignore him as best I could, wondering if I'd be alive at the next stop. I stared outside until the guy finally got off at the Oakland stop. He continued to harass me through the window (he apparently didn't like the way I looked right through him) until the doors closed and the train began to move. At this point, I couldn't help myself; I broke into a wide grin and gave him the biggest obscene gesture I could muster.

Since I moved to the NNJ/NYC area about 8 years ago I have ridden the NYC subway many times, but never have I been as concerned for my personal safety as I was that night on the SF BART. But when I carry my HT, I usually hide it under my coat.

Phil

THE ARRL LETTER - Volume 9, Number 10 - May 18, 1990 - Part 1 of 4

BOARD TO HONE CODELESS LICENSE STAND

League officials met recently to consider the ARRL position on proposed changes to the Amateur Radio licensing structure. The "strawman" committee, appointed by President Larry Price, W4RA, on recommendation of the Executive Committee, was charged with weighing the League's position in light of the FCC's Notice of Proposed Rule Making on the subject (for the full text of PR 90- 55 see April QST page 38).

The League's board of directors now actively seeks input from all interested members. The board will consider this input, as well as the recommendations of the April 21 working group, to formulate a position.

The "strawman" committee consisted of five directors, First Vice President George Wilson III, W4OYI, and Executive Vice President David Sumner, K1ZZ. Among their recommendations to the board:

* Reaffirmation that the Novice class license as a route of entry into Amateur Radio is absolutely essential.

* Support for the incorporation of Novice testing into the accredited Volunteer Examiner system. This would permit examination elements earned in obtaining a Novice license to be used for credit toward upgrading, without retesting.

* Pursuing rules changes to permit VECs to recoup examination expenses for Novice exams, provided that no fees are charged for any applicant under age 16.

* Retention of the Technician class license as a distinct class of amateur license, and its continued availability to new applicants.

* Clarification of the League's position with regard to Element 3A: that the existing Element 3A should be expanded by five questions (i.e., the pool should be expanded by 50 questions). Requirements for the Novice, Communicator, and Technician licenses would be as follows:
Novice: Elements 1A (5-wpm code) and 2 (30-question written);
Communicator: Elements 2 and 3A (30-question written);
Technician: Elements 1A, 2, and 3A;
Upgrading from Novice to Technician would require passing Element 3A;

Upgrading from Communicator to Technician would require passing Element 1A;

* Certificates of Successful Completion should be issued to candidates who pass either Element 1A or Element 2 without qualifying for a license by passing another element;

* Frequency privileges for Communicators should be as proposed in RM-6995 (the League's original codeless license proposal). The FCC proposal of a 200-watt PEP output power limit for Communicators was acceptable to the working group. However, since the only difference between Communicator and Technician qualifications is the 5-wpm code test, the Committee could find no rationale for denying Communicators control operator privileges for repeater and auxiliary stations. Therefore, the Committee recommended the Board reconsider its position on this matter;

* Technician licensees who have credit for Element 3B by virtue of having taken the old, 50-question Element 3 examination should retain this credit (permitting them to upgrade to General upon passing just the Element 1B 13-wpm code test);

* In all other respects, the committee recommended there be no departures from the ARRL position as adopted in RM-6995. The recommendations of the committee are just that--recommendations.

AWAITING "THE NEW CQ"

Subscribers to both CQ and Ham Radio magazines eagerly await the July issue of CQ, for the first indication of how CQ assimilates Ham Radio.

"[Ham Radio readers] can expect to see the best of what is good in the magazine you already know molded into an even better product," says Ham Radio publisher Skip Tenney, W1NLB, in the June--and final--issue of HR. "The expanded CQ," Tenney says in his final editorial, "will incorporate the best efforts of two of the most experienced publishing staffs anywhere in the Amateur world."

CQ, in an April 27 letter to advertisers, says "we'll be looking at a new circulation figure of just over 100,000. That includes newsstand sales of 32,500..."

CQ's advertising rates also are rising, by "less than 30 percent" (their letter stated).

While organizational planning is still "in the formulative stage," as one of the principals puts it, CQ will waste no time addressing the task of retaining former Ham Radio readers.

Articles accepted for publication by Ham Radio will not necessarily appear in CQ. Their authors were given the option of taking their work elsewhere or automatically letting CQ consider them.

As for staff, no immediate changes have been announced at CQ. Ham Radio assistant publisher J. Craig Clark, NX1G, will remain in New Hampshire, to

manage the Ham Radio Bookstore and to "develop new properties."

THE ARRL LETTER - Volume 9, Number 10 - May 18, 1990 - Part 2 of 4

TWO BLOWS STRUCK FOR 220

The Federal Communications Commission continues to consider ways in which the 220-222 MHz band might be used for non-amateur communications, while amateurs still occupy the segment and in spite of the matter being under appeal in federal court. Recent FCC proposals have given the League two more opportunities to remind the Commission that "action to implement the band in the Part 90 rules is premature, and subject to reversal by the Court."

"Bait and switch" is how ARRL General Counsel Christopher Imlay, N3AKD, referred to land mobile industry comments in FCC's PR Docket 89-552, in which it is suggested the Commission group the proposed 5 kHz voice channels into contiguous blocks of five or ten channels, and to permit time division multiple access (TDMA) schemes for data transmission.

In his Reply Comments, Imlay points out that the 25- or 50-kHz channels proposed by industry for 220-222 MHz in the name of "spectrum efficiency" already are available in existing land mobile bands.

"...the entire rationale for the reallocation of the 220-222 MHz band...is now gone ... It is time that the Commission reevaluated the premises which led to the reallocation of the 220-222 MHz band," the League's comments contend. "The conclusions in Docket 87-14 were never correct, and have been shown...to be untimely."

In PR Docket 89-599, FCC in December proposed a "Personal Emergency Locator Transmitter System (PELTS) within the 220-222 MHz band. In comments last March the League pointed out:
* The proposal was premature;
* Rules compliance would likely to be poor;
* Few non-amateurs have receivers for those frequencies--most scanners don't cover them.

The League, in its most recent comments on the matter (May 4), noted that professional search and rescue organizations also saw PELTS as unlikely to be effective, especially in light of the ongoing development of satellite locating systems and of the burden that would be imposed on users to acquire new equipment.

ARRL comments again concluded by seeking "no action" on the PELTS proposal, particularly in light of the uncertain status of the actual reallocation of the frequencies involved.

FDA ISSUES RF ADVISORY

A recent US Food and Drug Administration advisory concerning infant apnea monitors mentions their susceptibility to RF fields, but the risk appears to be minimal, according to experts.

The FDA Drug Bulletin (Vol. 20, No. 1) urges health care professionals to ensure proper setup and use of the monitors. The devices, used primarily to detect cessation of breathing, are used in both hospitals and in homes. The hospital units are more sophisticated than portable devices used in the home.

Infant apnea monitors are hooked up to a child by gluing two wires to the chest; the monitor detects changes in impedance across the wires, setting off an audible alarm. IA monitors are primarily subject to false alarms; fail-safe mechanisms in their microprocessors virtually ensure they will detect episodes of apnea.

The FDA safety alert letter mentions a number of possible flaws in set-up and use of IA monitors; among them:

* "Keep the monitor away from possible sources of interference such as electrical appliances"; and

* "Be aware that strong radio signals from nearby TV or radio stations, airports, ham radios, or police stations could interfere with the monitor, and check for this interference if the monitor is to be operated in such areas."

A biomedical technician contacted by The ARRL Letter said he has experienced not a single incident of an IA monitor interfered with by an RF field. The technician, who maintains the monitors for a home health care company, does say that older units, using analog technology, can be susceptible to all sorts of electrical interference.

Static electricity affects them; "You can get a false alarm by running your hand over the case of an older unit," he said. "A device with a compressor--a refrigerator or air conditioner--on the same circuit can cause a false alarm via a voltage spike."

On the other hand, every instance of failure the technician knew of was due to incorrect usage. His company recommends parents perform a power-up test every time their IA monitor is used.

Copies of the advisory letter are available from FDA, HFZ- 240, Rockville MD 20857.

THE ARRL LETTER - Volume 9, Number 10 - May 18, 1990 - Part 3 of 4

FCC ENFORCEMENT ACTIONS

On 1 April 1990 Amateur Radio operator Joseph A. Della Barba (N3HGB) of Annapolis, Maryland was fined $1000 for "operating a pirate radio station," according to an FCC public notice. An electronics technician and engineer from FCC's Baltimore and Laurel offices located the operator transmitting on radio equipment in his vehicle.

The unauthorized station, using the call sign WTNU, ("The Nation's Underground") had been initially overheard during routine monitoring of the aeronautical mobile band. Della Barba was operating on 25,000 kHz, a frequency assigned to the National Bureau of Standards station WWV. (FCC

Public Notice 13 April 1990).

Acting on a tip from a "local amateur radio operator," FCC's Seattle Office identified and fined one George M. Muchin for unauthorized and unlicensed operation of a marine radio transmitter. According to the FCC, Muchin, owner of Redmond Plumbing, was fined $1500 for using 156.575 MHz, a VHF marine frequency, for conducting non-marine business. Mobile direction finding equipment was used "to trace the transmissions first to a worker's truck and then to a private residence." (FCC Public Notice 30 April 1990).

Following several years of complaints by amateurs operating in the 40 meter band from the Pacific Northwest, FCC has tracked down and fined two amateurs for "willfully interfering" with other amateur radio communications. Robert N. Frizzell, W6UCB, of Beatty, Ore., and Richard L. Young, W6UGH, of Los Angeles, each were fined $1000.

FCC personnel observed Frizzell and Young "consistently operat[ing] adjacent to the operations of other amateurs and within the bandpass of state of the art receivers. When the affected amateurs moved, these two amateurs would follow and operate adjacent to them, again within the receiver bandpass of adjacent operators."

The case has been referred to FCC in Washington. (FCC Public Notice, 30 April 1990).

A licensed amateur has been charged with jamming a commercial broadcast satellite, according to the FCC. Thomas M. Haynie of Virginia Beach, Va., has been indicted by a grand jury in the Eastern District of Virginia. Haynie was charged with three counts of intentional interference and three counts of unlicensed operation of a satellite uplink.

Haynie, WB4PVK, is 38 and holds an Advanced class amateur license, according to FCC records.

On September 6, 1987, the indictment alleges, Haynie was uplink operator on duty at the Christian Broadcasting Network facility in Virginia Beach. On three separate occasions a video text message "completely overrode" programming carried on two satellites: Satcom IV and Spacenet I. The programming allegedly jammed was that of The Playboy Channel. (FCC News, 27 April 1990).

IARU PRESIDENT HONORED

International Amateur Radio Union president Richard L. Baldwin, W1RU, has received the Roy Stevens, G2BVN Memorial Trophy for service to international Amateur Radio. The triennial honor was unanimously awarded to Baldwin at the IARU's Region 1 conference, held last month in Spain.

Baldwin joined the ARRL Headquarters staff in 1948, served from 1975 to 1982 as general manager, and was an IARU representative at the general WARC in 1979.

Baldwin recalled his job interview at ARRL Headquarters 42 years ago. "When asked about my qualifications, by General Manager A.L. Budlong," Baldwin

said, "I replied 'I'm reasonably intelligent and I can type.'"

"Anybody can type," Budlong replied. "So what's your code speed?"

THE ARRL LETTER - Volume 9, Number 10 - May 18, 1990 - Part 4 of 4

TOWARD AN INTER-ISLAND ACCORD

Using Hurricane Hugo as just the latest example, Caribbean communications officers met recently to continue plans for cooperation in times of need. Their goal, to join in a "regional mechanism," would include relaxing third party restrictions, facilitate reciprocal licensing, and ease customs barriers between islands.

Amateur Radio representatives from 11 Caribbean nations met on St. Lucia in late April to discuss these issues. Included were Trinidad and Tobago; Grenada; St. Vincent; Barbados; St. Lucia; Dominica; Montserrat; Antigua; St. Kitts and Nevis; the British Virgin Islands; and Jamaica.

Meeting under an umbrella organization formed in 1980, the Pan Caribbean Disaster Preparedness and Prevention Project (PCDPPP), comprised of 33 Caribbean and Central American islands and countries, the group focused on presenting a collective front to regional governments and agencies, specifically the Caribbean Telecommunication Union.

Attending as observers and resources were Office of US Foreign Disaster Assistance communications officer Art Feller, KB4ZJ, Texas A&M telecommunications professor Pierre Catala, WA1UAT, and ARRL Field Services Manager Richard Palm, K1CE.

According to Palm, PCDPPP seeks to improve the dissemination of warnings as well as all communications in the event of a natural disaster such as Hugo. The strengthening of Amateur Radio bridges joins commercial telecommunications networks as part of the plan. For this reason, Palm says, the PCDPPP has worked closely with the region's amateur community, including sponsoring the late-April conference.

Several of the participants reported conducting emergency drills on their islands, and most are developing the use of packet radio.

Regularly scheduled nets, such as the twice-daily Antilles Emergency and Weather Net, also play a part in disaster communications. The conference agreed to promote greater participation in such nets and to encourage continued association of such nets with IARU, ARRL, and the Amateur Radio organizations of member countries.

Three conference working groups, Technical, Organizational, and Emergency Procedure, made recommendations to the overall conference, which agreed to form a new Amateur Radio regional organization. To that end a task force was formed.

At the conference, Palm noted the League's work to educate US amateurs in proper techniques during Caribbean emergencies, based on lessons learned from hurricanes Gilbert and Hugo and from Palm's meetings with Caribbean

amateurs in Trinidad and Jamaica.

W1AW RENOVATION UPDATE

Contributions to the Maxim Memorial Station renovation continue to arrive, from manufacturers as well as private individuals. The station, rededicated last July, is nearing completion (as if a ham station is ever complete, or permanent!), with some antennas yet to go up, according to W1AW station manager Eddy Pollock, W6LC.

Last week W1AW was the beneficiary of two Tandy 1000 TL/2 computer systems, through the auspices of Ed Juge, W5TOO, marketing director for the Tandy Corporation. These computers initially will be used--in conjunction with a Buckmaster CD ROM call sign data base--for record keeping and QSLing at the station, as well as for visiting operators to use in log keeping.

Tandy's gift, valued at some $6000, adds their name to a list of corporate supporters of the station that includes Andrew Corp., Bencher, Cushcraft, Digital Radio Systems, Hammond Mfg., Harris Corp., ICOM America, Kenwood USA, MFJ, and Ten-Tec.

Three plaques soon will be on public display at the station, listing individual donors at the $1000 and $500 levels, as well as recognizing corporate supporters of Amateur Radio's most famous station.

SAREX ON HOLD

The launch of shuttle STS-35 was aborted May 15 and postponed until month's end, at the earliest. STS-35 will carry WA4SIR and the SAREX (Shuttle Amateur Radio Experiment).

I was wondering if anyone knows if it is still possible to get the
TNC2 from TAPR as a kit. Or if not, where to look for the cheapest
TNC2 with Kiss support?

I have a need for a number of inexpensive basic TNCs. Some friends
of mine are interested in setting up a packet network in New Guinea.
They are missionary language translators and have very limited budgets.
Most do have portable pcs.

Any help with acquiring information would be appreciated.

A friend and myself are struggling along trying to prepare for our novice/tech test this July. I got a copy of 'morse tutor' for our computers and I've been doing quite well with it. My friend however says he just isn't picking it up. Does anyone out there have any experience learning code from software like this and what is the nets advice on how to use it. I have been running the teach mode for the group I'm working on for a few minutes, the going to test mode until I make a mistake. I then resume teach mode again for a few minutes.

I'm interested in how others have successfully used these tools.

Thanks,
John R. Schuch
(maybe in a couple of months I'll be able to put a call in my .sig)

In article <12012@shlump.nac.dec.com> koning@koning.enet.dec.com (Paul Koning) writes:
]> If the data is scrambled properly, it is virtually assured of self clocking.
]
]That's a common misconception. Scrambling has no effect on whether
]a code is self-clocking. All it does is change WHICH user data pattern
]causes absence of clocking.
]
]Unfortunately this mistake is common in certain parts of the communication
]industry. The reality is that the ONLY way to have guaranteed clocking is
]to use a code that has minimum transition density guarantees. For example,
]FDDI is self-clocking; SONET is not.
]

On the other hand, scrambling can be used for self clocking for most
communications schemes. For example, if you can stand the loss of
clock for 20 bits, then the probability of losing clock because
you didn't GUARANTEE clocking is about 1E-6 - probably better
than your BER anyway. This assumes:
(1) You are receiving and sending crystal controlled (I can't imagine
doing it any other way.
(2) You design your clocking so it can miss clocks and not do anything
silly.
(3) When a packet is retransmitted, it is not scrambled the same as
when it was first sent (again, any normal scrambling modem
will act properly in this regard).

So... from a perfectionist standpoint, scrambling won't work. From
any practical engineering standpoint (except perhaps in extremely
low SWR FEC/no-ACK protocols), scrambling will work just fine.

> waves, but I'm guessing it is spark-gap. The "damping" is the filtering
> used to select a frequency of a broad nature.

Damped Wave. - From the description of the oscillatory discharge of a
condenser, a clear understanding of the damped wave is obtained. The word
"damp", as use in connection with a radio wave, means to choke or to stifle,
to die out. The damped wave is choked off or stifled, according to the
characteristics of the circuit in which it is oscillating. ...
"Practical Radio Telegraphy, Nilson and Hornung, McGraw-Hill 1928"

Or in modern terms, a ringing resonant circuit decaying exponentially.

SB ALL @ AMSAT $ANS-118.01
DOVE STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 118.01 FROM AMSAT HQ
SILVER SPRING, MD APRIL 28, 1990
TO ALL RADIO AMATEURS BT

On the AMSAT-NA Operations Net of 22 April 90, Microsat command engineer
Bob McGwier, N4HY gave a brief rundown on the current status of the
BRAMSAT Project DOVE satellite. After a DOVE CPU crash in March, the
primary transmitter (on 145.825 MHz) was locked on in a condition where
no data was being transmitted. Routine commanding of the spacecraft
was impossible. Eventually, with the help of the moonbounce array
at W5UN and fortuitous circumstances, the CPU was reset and control
was regained. On the following day, the two meter transmitter
was turned off and the experimental S band transmitter was activated
as the only downlink during an interim recovery period.

A decision was made not to resume any DOVE operation on two meters until
a new software load could be accomplished. This meant that return packets
from the Microsat Boot Loader (running in onboard ROM) would have to be
recovered from the S band transmissions. DOVE's owner, BRAMSAT President
Dr. Junior DeCastro, PY2BJO, provided N4HY with an S band receive converter
and antenna system to be used in the recovery effort. When this equipment
was installed at N4HY, Bob was able to verify what other S band receiving
stations around the world (including ON6UG, K0RZ, and KF4AU) had
already discovered, that the phase shift keying modulation index on the
transmitter was much lower than expected. Simply put, the binary data
does not shift the S band carrier a full plus and minus 180 degrees as
it had been designed to. Listening on a sideband receiver, the signal
sounds like mostly carrier with data only at a low volume. Additionally,
data being sent via this transmitter is from the MBL which transmits
incomplete telemetry packets, and those only infrequently. Command
stations have experience with this data format, but it cannot be decoded
directly by regular TNCs so it is difficult for other operators to
participate in data collection though they may have S band gear.

Since the reset, it has been determined that DOVE is in a safe and
stable condition running the MBL firmware. N4HY has developed a DSP
based technique to decode with some certainty the undermodulated

packets returned on DOVE S band during software uploads. He expects to be able to load and verify a new operating system on DOVE with some difficulty and then resume 2 meter transmissions. A full recovery is expected.

During the time required to get the S-band receive gear and demodulation techniques developed, work has been proceeding on the first, rudimentary PBBS systems for LUSAT and PACSAT. After these systems are installed and in use (very shortly), full attention will be concentrated on the DOVE recovery.

AMSAT-NA and BRAMSAT recognize the popularity of DOVE and regret the inconvenience that these startup delays have caused to educators and other amateurs worldwide who are anxious to see DOVE begin its operational mission. It is, of course, imperative that all facets of spacecraft checkout and operation, including this first crash recovery, be done thoroughly and with the utmost care.

PROJECT OSCAR MEETING REPORT

HR AMSAT NEWS SERVICE BULLETIN 118.02 FROM AMSAT HQ
SILVER SPRING, MD APRIL 28, 1990
TO ALL RADIO AMATEURS BT

Future Plans Made During Project OSCAR Meeting

Project OSCAR's Executive Committee met on April 22 and has set forth on a number of new projects. Among the items covered was renewed interest to again produce the Project OSCAR Orbital Prediction Calendar Book. The purpose of the orbital prediction book is to provide simple and inexpensive tracking information to anyone interested in the low orbiting satellites such as Microsat, UoSAT, Fuji and the Radio Sputnik series of amateur satellites.

It was determined that Project OSCAR members would like to participate in future satellite projects. Therefore, the Executive Committee will be submitting thoughts to the group meeting in Marburg, West Germany in May, discussing ideas on a Phase IIID satellite.

Project OSCAR will look to develop a Mode S receive system from available (and cost effective) modules now available on the market. Project OSCAR members will complete this project and write up a description of the system for publication in the Amateur Radio media so that anyone interested in Mode S will be able to make the move into this new area of OSCAR communication.

Finally, in response to many who have asked for information, Project OSCAR will sponsor a seminar about operating on all of the available Amateur Radio satellites. This seminar will take place on September 29th and 30th on the San Francisco Peninsula. In addition to a full schedule of talks aimed at the beginning and advanced satellite user, there will be demonstrations available, plus published papers provided to all in attendance. Complete details of this OSCAR seminar, along with names of the speakers scheduled to speak will appear

in the AMSAT bulletins, on Packet and phone BBS', and the usual Amateur Radio Media. To receive complete registration information as soon as it's available, send a Self-Addressed Stamped Envelope (SASE) to:

OSCAR Seminar
Project OSCAR, Inc.
P. O. Box 1136
Los Altos, CA 94023-1136

UO-14 UPDATE

HR AMSAT NEWS SERVICE BULLETIN 118.04 FROM AMSAT HQ
SILVER SPRING, MD APRIL 28, 1990
TO ALL RADIO AMATEURS BT

New Bird is Hot Bed of High Speed Data Activity

The level of activity at 9600 baud on UO-14 demonstrates that it is relatively easy to become operational at that speed. A complete list of stations logged on the UoSAT-OSCAR-14 MHEARD list over the last week includes:

DF3LZ, DF5DP, DG3LAE, G0BDD, G3RUH, G4WFQ, G8TZJ, GM4IHJ, I2KBD, JA6FTL, JH1LVN, JH3FDA, JH7CKF, JR1EDE, JR1FRF, KA2MOV, KF4WQ, LU1BEE, LU8DYF, N4HY, ON6UG, VK3DTO, W7KRC.

It was reported that KA2MOV was able to connect to N4HY using 25 watts on transmit and omni-directional antennas for both transmit and receive.

UO-14's command team are planning to load increasingly sophisticated housekeeping software to the PCE this week. The new housekeeping software includes a "file system" for storing WOD and data frames from the Cosmic Particle Experiment (CPE). This data will be downlinked using the standard PACSAT Broadcast Protocol, inside AX.25 UI frames.

Once the housekeeping software is installed, Jeff Ward of the University of Surrey will begin working on the BBS software. This will be a host-mode BBS designed by Jeff and Harold Price, NK6K, specifically for the PACSATs.

[AMSAT thanks AMSAT-UK for the information for this bulletin]

AMSAT'S GREAT SHOWING AT DAYTON

HR AMSAT NEWS SERVICE BULLETIN 125.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 5, 1990
TO ALL RADIO AMATEURS BT

Radio Amateurs Show Great Enthusiasm For MICROSATs At Dayton Hamvention '90

At this year's Dayton Hamvention, many thousands of radio amateurs were exposed to the radio amateur satellite service and AMSAT. During the world famous event in which over 35,000 hams participated, over $21,000 was donated to AMSAT. This is taken as a significant expression of support for the MICROSATs and AMSAT's SAREX-II activities. In addition, over 190 hams either became new AMSAT members or renewed their existing membership.

Throughout the weekend, there was always a major traffic jam in front of the AMSAT booth as the friendly AMSAT volunteers worked to answer questions and provide information. All of the volunteers (AA0P, WD0HHU, VK5AGR, N4HY, W5IU, KO5I, W1XT, W3IWI, WA4GSS, K8QKY, K8MU, WA3GOV, WB2IBO, N2QQ, KA8JBA, Martha Sargarovitz, and Barbara Myers) put in long hours to help make this the best Dayton ever for AMSAT.

AMSAT sponsored two forums. AMSAT-NA General Manager and President Doug Loughmiller (KO5I) started things off with a discussion titled: "1990: Year of the Amateur Radio Satellite." At this very well attended forum, Doug presented WD0HHU with a gold watch given to him for his efforts in Kourou, French Guiana during the MICROSAT launch campaign. Doug also talked about where AMSAT has been and what its goals are for the upcoming years.

After Doug, Tom Clark (W3IWI) discussed the Shuttle Amateur Radio Experiment (SAREX) currently planned for mid May. Bill Tynan (W3XO), AMSAT-NA's VP for Manned Operations and news correspondent Roy Neal (N6DUE) further elaborated on the SAREX mission and what it means for hams and school age youngsters all over the world.

Finally, Bob McGwier (N4HY) gave a complete run-down on the MICROSATs. Bob stated that he and Harold Price (NK6K) plan to have all the MICROSAT mailbox BBS software working by Field Day '90. Also, the next time you hear

DOVE-OSCAR-17 (DO-17) on two meters, it will not only be sending packets but also voice transmissions.

During the Saturday evening banquet, N4HY was honored for his many technical contributions to amateur radio by having the "Technical Excellence Award" bestowed upon him by the Dayton Amateur Radio Association.

AMSAT-NA VP for Field Operations, Jack Crabtree (AA0P), coordinator of this year's AMSAT Dayton Hamvention volunteers, wants to thank all those who came by the booth at Dayton. Next year Jack hopes to have an even bigger AMSAT showing at the Hamvention, including an AMSAT dinner banquet.

TO ALL RADIO AMATEURS BT

Weberware 1.0 Imaging Software Now Available To Process WO-18 Pictures

Beta testing of Weberware 1.0 (WW 1.0) is complete their testing and it is now released for general distribution. This unique package made its debut at the Dayton Hamvention last week. Many a radio satellite enthusiast was thrilled as an actual picture captured from WEBERSAT-OSCAR-18 (WO-18) was processed on an IBM PC as they watched. Chris Williams (WA3PSD) of Weber State University (WSU) said that although the early pictures from WO-18 were perhaps not all that interesting, now that the ground controllers at WSU have a better understand of this MICROSAT's attitude motion, they have modified the on-board software so that more pictures of the earth are now being snapped. In addition, the software now maintains better control the CCD camera iris settings and settling time. Through more operational experience, many more exciting pictures of the earth are expected soon.

Weberware 1.0 is designed to work on IBM PC clones which support EGA or VGA graphics. WO-18 is constantly sending picture data and the imaging data can be easily collected with a PSK modem. For further information about Weberware 1.0, contact the AMSAT-NA software exchange at (301) 589-6062.

New Software Being Uploaded Into UO-14

The past several weeks have seen 9600 baud packet activity begin through UO-14's Packet Communication Experiment (PCE). This week a much more sophisticated multi-tasking operating system, known as qcF, was installed in several stages. The first stage involved the multi-tasking kernal and the

Prototype Housekeeping Task (PHT). The PHT greatly facilitates the loading of software into the RAM memory of UO-14. This new software also allows ground stations to digipeat through the PCE. Many stations have been using this digipeating capacity of UO-14 to test their 9600 baud modems. Also added to the PHT software is the telemetry support for the Cosmic Particle Experiment (CPE). The CPE continuously monitors cosmic particle activity and the observations are reported in 53 bytes of data in the telemetry every five minutes.

To complete the final software load to UO-14 so that its mailbox BBS will be in operation, a great deal more work needs to be done. The software which performs the BBS functions include a file server system, the AX.25 packet handling algorithms, and more telemetry development to handle the Whole Orbit Data (WOD) tasks. A major programming milestone was reached on April 27 when a partial load of the final flight software was loaded into UO-14. Software engineers NK6K, G0/K8KA, and WB6YMH are working very diligently on both sides of the Atlantic to get the message store-and-forward software completed soon.

[ANS would like to thank G0/K8KA for providing the information for this bulletin.]

SILVER SPRING, MD MAY 5, 1990
TO ALL RADIO AMATEURS BT

Shuttle Amateur Radio Experiment (SAREX) Set To Fly On May 16, 1990

STS-35 is now scheduled to lift-off on May 16, 1990. It will be carrying not only the ASTRO-1 experiment but also SAREX-II. The following is a discussion of the goals of SAREX-II by NASA and the ARRL.

SAREX-II is a secondary payload on STS-35, currently scheduled for launch on May 16, 1990. It will be located in the Aft Flight Deck of the Space Shuttle Columbia. Ron Parise, WA4SIR, the Payload Specialist and astronomer on Columbia will be the Astronaut ham operator.

SAREX-II-02 is a secondary payload on STS-37, currently scheduled for launch on November 1, 1990. It will be located in the Aft Flight Deck of the Space Shuttle Atlantis. Ken Cameron, KB5AWP, the pilot of Atlantis will be the Astronaut ham operator.

The American Radio Relay League (ARRL) is the customer on the SAREX-II payloads. NASA gave its authorization for SAREX operations for the following reasons:

To encourage our youth to become excited about science and technology, and

To familiarize large numbers of the general public with manned space flight

NASA's intent in making astronauts available for SAREX operations is to involve the largest possible number of people, particularly youngsters, in Amateur Radio and the US space program. With amateur radio clubs and hams, our astronauts will speak over amateur frequencies directly with large groups of students, showing teachers, parents and communities how Amateur Radio energizes youngsters about science, technology, and learning.

You can easily become a part of this activity in your local school, as the astronauts will operate the SAREX equipment in the amateur two meter band. You will be able to send and receive messages via packet for periods of about 12 hours daily. The astronauts' work schedules will determine your chances for a voice or television message, but Ron and Ken may have an hour or more each day for these modes.

The Johnson Space Center's Amateur Radio Club station, W5RRR, in Houston, Texas, will re-transmit astronaut's signals to WA3NAN, at Goddard Space Flight Center, in Greenbelt, MD (near Washington, DC), and to W6VIO, at the Jet Propulsion Laboratory in Pasadena, CA. These stations, plus W1AW and several VHF and UHF repeater groups, will re-transmit the signals on most amateur bands so that you and the students can copy the communications. You will hear NASA Mission Commentary, frequent bulletins to advise listeners of astronaut planned transmissions, and all amateur two-way voice and amateur television transmissions with the shuttles. Using a simple hand-held transceiver, you can open the world of science to hundreds of youngsters. Students themselves can take part in the shuttle flight via a packet connection, and some will even be able to talk directly to the astronauts in orbit.

ARRL and AMSAT are co-sponsoring these exciting missions, with AMSAT heading up technical operations. Hundreds of Amateur Radio operators have already been working behind the scenes for months. The ARRL takes the lead with information and educational support. ARRL Educational Activities Branch (EAB) and NASA HQ will create lesson plans for teachers. All you need to provide is a 2-meter rig or a packet radio setup. If you are a teacher or instructor, contact ARRL EAB to get everything you will need and regular news updates. If you are a parent or a grandparent, contact ARRL EAB and a local school. EAB will send you materials, including ways to convince teachers and school administrators that Amateur Radio is an important discipline the school should take advantage of on a full-time basis.

This a tremendous opportunity for you to showcase SAREX 1990 and amateur radio to kids of all ages in a big way. Plan on being a part of it; contact ARRL EAB now and give your best to our exciting hobby and to our hope for tomorrow: America's youth.

Listen to the ARRL Bulletins on W1AW (see QST for CW and voice bulletins) on a daily basis; and to the AMSAT Nets on Tuesdays (U. S.), 3.840 MHz, 01:30Z to 03:00Z, and on Sundays (international), 14.282 MHz, 18:00Z to 21:00Z, +/- QRM.

[ANS would like to thank ARRL and NASA for this contribution. Stay tuned next week to the ANS bulletins for more details about the STS-35 mission and its amateur radio operations.]

PHASE III-D DESIGN MEETING

HR AMSAT NEWS SERVICE BULLETIN 125.06 FROM AMSAT HQ
SILVER SPRING, MD MAY 5, 1990
TO ALL RADIO AMATEURS BT

Preliminary Design Review for New Satellite Held in Germany

Amateurs from around the world who are involved in the Radio Amateur Satellite Service are meeting in Marburg, West Germany from May 7 through May 9 to begin work on another major amateur satellite project. The purpose of the meeting is to set specific design goals for Phase III-D. The three days of meetings will cover a wide range of topics. Areas to be discussed will include: launch opportunities, orbit choices and constraints, transponder choices, antenna design, on-board computer systems, and propulsion systems. In addition to setting hardware and software design goals, equally important discussions will focus on labor division between groups, monetary commitment required, and development of a communication structure between groups involved in the program.

AMSAT-NA will be represented at the meeting by Jan King, W3GEY, VP-Engineering, Bob McGwier, N4HY, Dick Jannson, WD4FAB, and Dick Daniels, W4PUJ. (It appears that these guys just can't seem to grasp the concept of "taking a break").

Once formal design goals have been determined, they will made available through the AMSAT News Service.

NEW AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 125.08 FROM AMSAT HQ
SILVER SPRING, MD MAY 5, 1990
TO ALL RADIO AMATEURS BT

New Transponder Schedule in Effect After Magnetorquing

Command Stations have been magnetorquing AO-13 during the perigees of orbits this past week. This procedure is essentialy complete and has re-aligned AO-13 for better pointing (squint) angles. A new transponder schedule has been announced by the AO-13 Command Station Team:

AO-13 Transponder Schedule from 05 May 90

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The best estimate of the current attitude is:

BLON = 180 and BLAT = +3 for 05 May 90

More exact values will be announced soon. Only the Mode-S transponder and the Mode-B beacon will be ON from MA 135 to MA 140.

AO-10 is currently experiencing poor solar panel illumination angles and until further notice its transponder is not available for use.

Subj: SAREX News Bulletins

SB SAREX @ AMSAT < W3IWI $SAREX.001
SAREX Bulletin #1: Concerning logs

SAREX INFORMATION BULLETIN SAREX.001
de W3IWI 5/6/90

The WA4SIR flight aboard the STS-35 flight of the Shuttle Columbia is still officially scheduled for early May 16th (GMT), although there are some hints that it might slip by one day. The SAREX mission will carry the packet ROBOT automatic QSO machine which will allow many amateurs around the world to have two-way packet QSO's with the Shuttle during the times when our ham astronaut, Ron Parise is busy.

To work the ROBOT, you transmit on 144.950 MHz and listen to the Shuttle on 145.550 MHz. Subsequent SAREX information bulletins will give you operating hints and describe the schedule in more detail.

If you are successful in making a two-way QSO, you call and your unique QSO serial number will be automatically logged and you will receive a QSL card after the mission. You will know you met all requirements of a two-way QSO by seeing your call in the QSL beacon which will be sent every 2 minutes and looks something like:

WA4SIR>QSL <UI>:
NI3F/186 WB2TNL/185 W3IUI/179 WB3AFL/177 NF3N/176 WA3EPT/175
N4QQ/174 W3IWI/172 JY1/153 U6MIR/127

If you are heard by the ROBOT, your call will appear in the QRZ beacon which will look something like:

WA4SIR>QRZ <UI>:
#3405-NE3H NI3F K1LNJ WB2TNL WB3ILO N3ACL N3FWX WA3TSD WA3USG
etcetera

where the #3405 is a serial number incremented every 2 minutes when the QRZ beacon is sent.

Unlike the QSL "worked" list, the QRZ "heard" list is not retained in the ROBOT and the laptop computer on the shuttle. In order to send SWL cards to those who were heard, it will be necessary to have amateurs around the world help to collect the list. When you are monitoring the WA4SIR SAREX transmissions, try to capture the beacons and send them in to us in machine readable format. We are only interested in the QRZ and QSL beacon information; please strip out everything else (like QSOs monitored, any other beacons, etc.). You may send it through the amateur packet network addressed like this:

SP SAREX @ W3IWI.MD.USA

or via the Internet addressed like:

sarex@tomcat.gsfc.nasa.gov

and make the Subject: field contain the date/time of the beacons like:

May 19 @ 03:42z

/EX
SB SAREX @ AMSAT < W3IWI $SAREX.002A
SAREX Bulletin #2: Hints and Suggestions

SAREX INFORMATION BULLETIN SAREX.002
de W3IWI 5/6/90

Here are several hints that may help you make a successful packet QSO with the SAREX ROBOT that will fly with Ron Parise, WA4SIR in mid-May.

1. Frequencies: Your transmitter uplink frequency should be 144.950 MHz and you should listen for the shuttle downlink 600 kHz higher on 145.550 MHz. Under no conditions should you transmit on the 145.550 downlink!

Since there may be other packet or voice activity in your area on these frequencies, local coordination to insure a clear frequency during the ten day STS-35 mission may be needed.

2. Modulation: The uplinks and downlinks are ordinary AFSK/FM 1200 BPS signals, just like most terrestrial VHF packets. No special modems are needed. You are advised to check your transmitter's FM deviation and set it to 3 kHz or less. Most radios are typically set to 5-6 kHz and this will be too wide because of doppler shifts. If you don't have a deviation meter, listen on another radio and crank the tone level down until you hear the volume drop noticeably. Most people run too much deviation on their packet signals anyway, and you will probably find this improves the reliability on terrestrial paths too!

3. When to hear/work the shuttle: During the mission Keplerian elements and predictions will be sent frequently by WA3NAN, W5RRR, W6VIO, and many local FM repeaters, as well as by packet bulletins addressed to @AMSAT. Check with your local AMSAT area coordinators for information in your area. In general in the USA, the windows are in the late evening and early morning hours. Don't expect the SAREX hardware to be activated until the second day of the ten-day mission. Because the inclination of the shuttle orbit is only 28.5 degrees, the signals can only be heard between about +43 and -43 degrees latitude.

[continued in part 2]

/EX
SB SAREX @ AMSAT < W3IWI $SAREX.002B
SAREX Bulletin #2: Hints cont'd

SAREX INFORMATION BULLETIN SAREX.002 continued
de W3IWI 5/6/90

4. LISTEN!!!: Most packeteers don't listen to the BRAAAAP! from their radios, but you should listen during the shuttle activity. If Ron is

personally available, he may turn off the SAREX packet hardware and be QRV on voice.

5. Connecting to the shuttle: All you do is to issue a connect. If you are heard, you will see something like this:

cmd: CONNECT WA4SIR
*** Connected to WA4SIR
#191--- Tnx QSO with the SAREX Shuttle "ROBOT" automatic QSO machine
*** DISCONNECTED

When the ROBOT hears your "ack" of its transmission, it will disconnect and you will be in the log. Because the ROBOT queues information for 3 seconds and sends several replies in one transmission, you should set your DWAIT to about 4 seconds.

6. Multiple QSO's: Once you have worked the ROBOT and make it into the log, no further QSO's from you will be logged (even if you use a different SSID). Give others a chance and don't connect multiple times!

7. Monitor!!!: Every 2 minutes a beacon addressed to QRZ will list stations heard recently, and the QSL beacon will list those worked. Every 3 minutes the Metabeacon (up to 1.7 kbytes in 7 packet frames) addressed to QST will send text describing shuttle activities. Monitor these beacons to keep informed. In Bulletin #1 we ask for you to submit copies of the QRZ and QSL beacons you copy.

8: Your chances for success: Signals from many hundreds of stations can be heard from the shuttle. With FM transmissions, only the strongest signal "wins", just like in a DX pileup. To help, the ROBOT can have up to 9 QSO's in progress at any one time. Perserverance and a well equipped station will help -- but if activity levels are high and the uplink channels are busy, it will be a matter of luck.

SB SAREX @ AMSAT < W3IWI $SAREX.003
SAREX Bulletin #3: ASTRO-1

SAREX INFORMATION BULLETIN SAREX.003
de W3IWI 5/6/90

Despite all the SAREX activity, our STS-35 ham astronaut Dr. Ron Parise, WA4SIR, is NOT officially going into orbit for the ultimate DXpedition! The reason for the STS-35 mission is to fly ASTRO-1.

With the recent successful STS-31 mission deploying the Hubble Space Telescope (HST) was the first step of an astronomical "double-header". It will be followed in mid-May by the ASTRO-1 mission which will carry a number of specialized telescopes on its 10 day mission. Ron is one of the STS-35's crew of seven which also includes

Vance Brand, Mission Commander
Col. Guy Gardner, Pilot

Dr. Bob Parker and Mike Lounge, Mission Specialists
Drs. Jeff Hoffman, Sam Durrance and Ron Parise, Payload Specialists

The ASTRO-1 Observatory in the STS-35 payload bay consists of four instruments. The first three are mounted on a single pointing systems and fly above the earth's atmosphere to observe in the ultraviolet spectral regions:

1. HUT: The Hopkins Ultraviolet Telescope from Johns Hopkins Univ. is a spectroscopic instrument for observing faint objects like quasars, active galactic nuclei and normal galaxies in the far UV.

2. UIT: The NASA/Goddard Ultraviolet Imaging Telescopy is designed to obtain images (pictures) of hot stars and galaxies with a wide field of view.

3. WUPPE: The Wisconsin Ultraviolet Photo-Polarimeter Experiment is intended to observe the polarization of UV light from quasars, hot stars and galaxies.

This cluster of three UV instruments work together and should make 200-300 observations during the mission.

The fourth instrument is an X-ray experiment with its own independent pointing system:

4. BBXRT: The Broad-Band X-Ray Telescope views high-energy objects like active galaxies and quasars. While BBXRT can be operated independently of the 3 UV instruments, it can be slaved to the UV telescopes for coordinated observations. It is also expected to make 200-300 observations during the mission.

The ASTRO-1 mission is but the first of a series. These and similar instruments will be reflown on later missions. ASTRO requires an orbit with maximum time at night, and minimum exposure to charged particles in the South Atlantic Anomaly -- these requirements dictate a nighttime launch from Cape Kennedy.

Subj: SAREX.004: Launch Delay

SB SAREX @ AMSAT < W3IWI $SAREX.004
WA4SIR SAREX/STS-35 LAUNCH DELAYED

SAREX Bulletin SAREX.004
de W3IWI 5/9/90

The flight of WA4SIR with the SAREX hardware aboard the Shuttle Columbia is delayed at least 2 weeks, meaning the flight will be in June at the earliest. The problem is contamination in a valve in

one of the two redundant freon cooling systems. All the tubing associated with the valve is sweated together and there is a lot of concern about using torches in the orbiter to fix it on the launch pad. Normally a repair like this would be done in Orbiter Processor Facility, but this would mean a rollback of the Columbia and a long delay which would in turn force a re-scheduling of the mission. Since the valve replacement is not a usual activity, it is not possible to predict the delay. Stay tuned for more information.

The following is excerpted from a 5/9 NASA press release:

NASA managers today decided to replace an apparently faulty valve in the orbiter Columbia's freon coolant loop. The work, will likely delay the launch of STS-35 by 2 to 3 weeks. A better es- timate of the time required to perform the work will be available early next week. Shuttle managers assessed the relative risks associated with performing the work at the launch pad, versus in the Orbiter Processing Facility, and decided that completing the replacement and checkout on the pad is as safe and effective.

"We are obviously disappointed that we are not ready to fly," said Space Flight Associate Administrator Dr. William B. Lenoir. "However, this particular system is absolutely critical to the safety of the crew and overall mission success, so we have decided to change the component."

SILVER SPRING, MD MAY 12, 1990
TO ALL RADIO AMATEURS BT

Payload Cooling Problem Delays STS-35/SAREX-II Mission

NASA managers this week announced that they have decided to delay the launch of STS-35 due to a problem in a freon cooling system designed to keep the temperature of electronic instruments in the ASTRO-1 Observatory payload within safe limits. The repair of the faulty cooling valve in Shuttle Columbia could take up to three weeks depending on if the work can be done at the launch pad. It is hoped that Columbia will not have to be rolled back to the Orbiter Processing Facility for this work. On this STS-35 mission, payload specialist Ron Parise (WA4SIR) will be be the station operator of WA4SIR-1 for the Shuttle Amateur Radio Experiment (SAREX) that will consist of

a ROBOT packet station and voice operation on 2 meter FM.

Based on information from NASA press releases, it appears that the STS-35/SAREX mission will not be launched before the first week of June. And that depends on how well this never-done-before repair goes. As soon as ARRL/AMSAT officials have be notified about the new launch date, all pertinent information will be issued immediately via ARRL bulletins, ANS bulletins, and AMSAT Nets.

SILVER SPRING, MD MAY 12, 1990
TO ALL RADIO AMATEURS BT

Numerous Regularly Scheduled AMSAT HF Nets Provide Timely Information

With events occuring so quickly in the world of amateur radio satellites, the quickest place to find information about operational news is on one of the many weekly HF AMSAT Nets. The following is a schedule some of these nets:

DAY TIME FREQUENCY NCS COMMENT

Sunday 09:00 UTC 14.280 MHz ZS6AKV AMSAT-SA Net
Sunday 10:00 UTC 3.685 MHz VK5AGR AMSAT Australia
Sunday 19:00 UTC 14.282 MHz WD0HHU AMSAT International Net
Sunday 19:00 UTC 21.280 MHz W8GQW Simulcasts On AO-13 when in View On 145.955 Mode B
Sunday 23:00 UTC 18.155 MHz N4QQ Excellent DX Windows
Tuesday 9:00 P.M. EDT 3.840 MHz W8GUS AMSAT East Coast Net
Tuesday 9:00 P.M. CDT 3.840 MHz W0CY AMSAT Mid America Net
Tuesday 9:00 P.M. PDT 3.840 MHz KI6QE AMSAT West Coast Net
Saturday 15:00 UTC 28.460 MHz WB2YGA AMSAT Beginner's Net
Saturday 10:00 UTC 14.280 MHz PA0DLO AMSAT European Net
Saturday 22:00 UTC 14.282 MHz ZL1WN AMSAT South Pacific Net

In addition to these weekly nets, there are also AMSAT Operations Nets held on AO-13 on a regular basis. The Operation's Net Schedules are published by AMSAT VP of Operations, Courtney Duncan (N5BF). If you are unable to copy any of the above nets, the AMSAT News Service (ANS) bulletins are found on many packet radio BBSs throughout the world. The ANS bulletins contain the latest operational information.

The AMSAT/DRIG land-line BBS contains the not only the current ANS bulletins for the week but also the bulletins for the past several months and other timely information. The AMSAT/DRIG BBS can be reached at (214) 394-7438. Check into the AMSAT Net nearest you and stay up to date in the exciting world of OSCAR satellites.

MOUSE DRIVER PROBLEM WITH INSTANTTRACK

HR AMSAT NEWS SERVICE BULLETIN 132.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 12, 1990
TO ALL RADIO AMATEURS BT

Microsoft Software Found to Cause Intermittant Problems

Some InstantTrack users have recently discovered a problem where the map "goes away" or "freezes" when they use their mouse. InstantTrack's author Franklin Antonio (N6NKF) has determined that this problem is a result of a conflict with the Microsoft mouse driver [MOUSE.COM] versions 7.00, 7.01, 7.02, and 7.03. Changing to a mouse driver version earlier than 7.00 or later than 7.03 is the cure. An update of InstantTrack is not required to resolve this problem.

Microsoft is aware of the problem, as it occurs with many programs other than InstantTrack. InstantTrack users who are experiencing this problem should contact Microsoft and ask to obtain version 7.04 of MOUSE.COM.

TELEMETRY ARCHIVE FORMAT ANNOUNCED

HR AMSAT NEWS SERVICE BULLETIN 132.04 FROM AMSAT HQ
SILVER SPRING, MD MAY 12, 1990
TO ALL RADIO AMATEURS BT

OSCAR Telemetry Archive Data Submission Format Announced

Reid Bristor (WA4UPD), AMSAT-NA Microsat Data Archive Manager has released the following information intended to govern submissions to the telemetry archive. Submissions using any file naming convention will be accepted through June 1, 1990 as previously announced. Following that date, files submitted not conforming to the following requirements may be returned for updating by the submitter.

Data is currently being stored within the archive in raw format since this form contains all information and uses the smallest amount of file space. Abbreviated submissions may consist only of raw digital telemetry or CW.

Whole Orbit Data collected from the Microsats to date has been archived; it was collected in single sessions and downlinked repeatedly afterwards. Future WOD reports and all live data, past, present, and future are requested from all satellite listeners.

Reid reports that submissions of and requests for Microsat data are picking up.

DATA SUBMISSION REQUIREMENTS

MEDIA FORMAT:** IBM 5 1/4", 180k,360k,1.2m
IBM 3 1/2", 770k,1.44m

COMMODORE 1541, 1571, 1581
DEC RX01/02, RX50, TK50

FILE FORMAT: 1 file per pass
Filename - mmddhhmm.ssx
mm = Month (02=Feb, 05=MAY, 11=NOV, etc.)
dd = DAY (Correct UTC DAY)
hh = HOUR OF AOS (UTC)
mm = MINUTE OF AOS
ss = SATELLITE NUMBER (17 = DOVE, 19 = LUSAT, etc.)
x = DATA TYPE AS INDICATED

DATA TYPE (x) - A = ASCII (DOVE ascii text, N4HY dump)
C = CW (LUSAT, FO20, AO13, etc.)
P = Processed (N4HY, or LU7ABF, etc.)
R = RAW (KISS format)
T = TELEMETRY
* W = WEBERSAT info

"*" indicates additional characters will be assigned as
WEBERSAT PICTURE data matures.

"**" For accomodation of other disk formats, contact WA4UPD.

NEW AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 132.06 FROM AMSAT HQ
SILVER SPRING, MD MAY 12, 1990
TO ALL RADIO AMATEURS BT

New Transponder Schedule in Effect After Magnetorquing

Command Stations have completed magnetorquing of AO-13 during the perigees of
recent orbits. This procedure is essentialy complete and has re-aligned
AO-13 for better Sun angles. The new transponder schedule has been announced
by the AO-13 Command Station Team:

AO-13 Transponder Schedule from 05 May 90

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The best estimate of the current attitude is:

BLON = 180 and BLAT = +3 for 05 May 90

More exact values will be announced soon. Only the Mode-L transponder and the
Mode-S beacon will be on from MA 125 to MA 130. Cross mode B and S QSOs are
possible during MA 135 to 140.

AO-10 is currently experiencing poor solar panel illumination angles and until
further notice its transponder is not available for use.

FO-20 ELEMENT SET PROBLEMS NOTED

HR AMSAT NEWS SERVICE BULLETIN 132.07 FROM AMSAT HQ
SILVER SPRING, MD MAY 12, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NAs Orbital Data Manager, Dick Campbell, N3FKV has
been informed by Tak Okamoto of JAMSAT that the NASA
elements for FO-20 are in error. It appears that NORAD is tracking
another vehicle launched with MOS-1B and FO-20 (called DEBUT).
This vehicle is about 2.75 minutes behind FO-20 and the elements
from NASA appear to be for this spacecraft. The current elements
being distributed for FO-20 are valid if approximately 2.5-3.0
minutes are added to the user's clock, which should be acceptable
in most cases. Dick is working to resolve this element set problem.

Dissemination of this information to FO-20 users will be appreciated.

SAREX/WA4SIR flight May 30th

SAREX Bulletin SAREX.005
de W3IWI May 19, 1990

AMSAT has received word that launch of the Shuttle Columbia STS-35 mission with Ron Parise, WA4SIR and the SAREX amateur radio hardware may now take place as early as Wed. May 30 at 04:38z. A flight readiness review that will confirm the launch date is planned for Thurs. May 24.

The NASA launch status report issued 14:30z on Friday, May 18th from Cape Kennedy reports:

STS-35 - COLUMBIA (OV 102) - PAD 39-A

"A new flow proportional valve was successfully installed in Columbia's freon cooling system. A leak check of the freon cooling system pump is planned today. Later today, vacuuming of the system will begin and will continue through the weekend. Early next week, the system will be filled with refrigerant and tested. Repair work and associated testing of the freon cooling system is estimated to be complete by next week."

"Payload officials are continuing to monitor the status of the Astro payload. The Broad Band X-ray Telescope, one of the Astro-1 telescopes, was serviced with argon yesterday."

"Pre-launch activities scheduled this weekend include the installation of ordnance devices, pressurization of the orbiter's hypergolic propellant tanks and loading the dewars, or storage tanks, on the pad's structure with liquid oxygen and liquid hydrogen reactants. During the launch countdown, the orbiter's fuel cell storage tanks will be loaded from these dewars."

Based on an 04:38z launch, the following preliminary Keplerian elements have been supplied by W5RRR at the NASA Johnson Space Center. First the "2-liner" element set JSC-0011:

STS-35
1 00035U 90150.24513889 .00031000 22174-3 0 110
2 00035 28.4690 148.3930 0005720 246.6067 119.6564 15.71792660 20

And the same data in the longer "AMSAT standard" format:

Satellite: STS-35
Epoch time: 90150.24513889
Element set: JSC-0011
Inclination: 28.4690 deg
RA of node: 148.3930 deg

Eccentricity: 0.0005720
Arg of perigee: 246.6067 deg
Mean anomaly: 119.6564 deg
Mean motion: 15.71792660 rev/day
Decay rate: 3.1e-04 rev/day^2
Epoch rev: 2

ZRO TEST SCHEDULE ANNOUNCED

HR AMSAT NEWS SERVICE BULLETIN 139.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 19, 1990
TO ALL RADIO AMATEURS BT

Station Receiving Tests Schedule Announced

The ZRO Memorial Technical Achievement Award Program, or "ZRO Test" will be reactivated in late May following the mid-May reorientation of AMSAT-OSCAR-13. This activity is a test of operating skill and equipment performance.

During a typical ZRO run, a control station will send numeric code groups using CW at 10 words-per-minute. At the beginning of the run, uplink power from the control station is set so that the downlink matches the general beacon downlink strength. This is level "zero". The control operator will send and repeat a random five-digit number, then lower uplink power by 3 dB (half power) and repeat the procedure with a new random number. This pattern is repeated until a level 27 dB below the beacon is reached (level "nine").

A participating listener monitors the downlink signals until they can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve receiving station performance to a point where the lower level downlink signals can be copied (levels 6 through 9).

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" tests on 435.945 MHz.

Saturday May 26, 1990 at 2230 UTC "JL"
Sunday May 27, 1990 at 0010 UTC "B"
Sunday June 03, 1990 at 0210 UTC "JL"
Sunday June 03, 1990 at 0350 UTC "B"
Saturday June 16, 1990 at 2200 UTC "JL"
Saturday June 16, 1990 at 2340 UTC "B"

Saturday June 30, 1990 at 1840 UTC "JL"
Saturday June 30, 1990 at 1930 UTC "B"

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

PHASE 3A REMEMBERED, PART I

HR AMSAT NEWS SERVICE BULLETIN 139.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 19, 1990
TO ALL RADIO AMATEURS BT

PHASE 3A Lost Ten Years Ago May 23, 1980, Part I

Next Wednesday marks the tenth anniversary of the death of an OSCAR -- an OSCAR which had all the potential of being a great satellite. On May 23, 1980 Phase 3A sat atop the Ariane launch vehicle known as LO-2, attach sideways to the huge Max Planck Institute's Firewheel experiment (See ORBIT June/July '80, pg 9). On that day optimism was running high at the European Space Agency's Kourou, Fr. Guianna launch center because of a previous launch success, and there was no reason to think that LO-2 wouldn't be equally successful. For those who are straining to remember, AMSAT President Tom Clark (W3IWI) was giving the "play-by-play-action" from the Goddard Space Flight Center (GSFC) radio club station, WA3NAN, to radio amateurs around the world through the AMSAT Launch Information Net/Service (ALINS). The launch window opened at 11:30 UTC; because of intermittent rain showers and minor equipment malfunctions "holds" were common during the first hours of the launch window. Finally, the LO-2 vehicle lifted off at 14:29:40 UTC. At this point thousands of hams were holding their breaths as FY7KRU and WA3NAN provided the commentary on the last few moments Phase 3A's short life: at 14:32:57 UTC French controllers were heard saying things like: "non-nominal flying...problem in one engine...the rocket is going down...Kourou radar still tracking" and finally, the worst shock of all, the word "splashdown" was uttered. Phase 3A never reached orbit and the greatness it was destined for. Jan King, holding back tears, summed it up shortly after the launch failure when he said that "the [radio amateur] community will never know what they lost today."

PHASE 3A, REMEMBERED PART II

HR AMSAT NEWS SERVICE BULLETIN 139.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 19, 1990

TO ALL RADIO AMATEURS BT

Phase 3A Lost Ten Years Ago May 23, 1980, Part II

Jan, Tom, and many of the volunteers who had helped build Phase 3A listened with great sadness as they realized that the focus of many thousands of hours of effort (Jan estimated 30 man years!) was now sitting at the bottom of the Atlantic. Jan recently related the events of that day to WD0HHU saying that upon realizing what had happened he flung a very large book across the room and shouted something appropriate at the top of his lungs. Now, however, he says he doesn't recall what he said -- it is all a "blurr." It should be noted that Jan and the other volunteers were not very far from the tiny little building on the GSFC grounds where Phase 3A was built, integrated, and tested.

According to Tom Clark, "the gloom, despair, and depression lasted for about a day" when Jan and Karl Miezer (DJ4ZC) were heard saying: "Darn it! We worked to hard to quit now. Lets try again. Lighting can't strike twice." At that point Tom wrote to all the AMSAT members requesting their moral and financal support in order to start Phase 3B. The reponse was immediate: over $30,000 was raised in a few months to start the construction of Phase 3B. This unequivocal show of support proved that radio amateurs from around the world wanted to see the AMSAT OSCAR satellite program continue. Recovering quickly from this disaster, AMSAT volunteers realized they still had the knowledge and know-how to build another OSCAR satellite and another: Phase 3B became AO-10, and later, Phase 3C became AO-13.

This week, May 23, 1990, one decade later, take a moment to think about Phase 3A, at 14:36:38 UTC when mission controllers in Kourou announced a "splashdown."

UO-14 9600 BAUD UPDATE

HR AMSAT NEWS SERVICE BULLETIN 139.04 FROM AMSAT HQ
SILVER SPRING, MD MAY 19, 1990
TO ALL RADIO AMATEURS BT

TNC operations at 9600 bps

Jeff Ward G0/K8KA and other members of the University of Surrey Engineering Team have recently been experimenting with 9600-baud operation using KISS software on TNC-2 clones. The clones used are a Pac-Com TINY-2 and an MFJ 1270. Initially, a version of KISS dated "26 Mar 87" was used but it was found that this version did not work very well for near-full-duplex 9600-baud KISS operation.

Jeff et. al. upgraded the firmware in the TNCs to a version of KISS dated "20 Mar 88". They found that operating on either the Pac-Com or the MFJ TNC with the updated KISS firmware will correctly receive a continuous stream of 9600 baud packets and relay them to the host computer at 9600 baud. The TNC did not seem to drop packets, even when operating at the 2 MHz standard clock speed. It is believed that this is the version of KISS which shipped with the

current TAPR firmware version 1.1.7.

Jeff reports that, unfortunately, with a 9600 baud synchronous input stream and a 9600 baud asynchronous output stream, the TNC's buffers begin to fill up. When the buffer fills (after a minute or so), the TNC crashes. An extra long packet is passed to the host, and operation (on the async side) ceases. You can cure this by turning the async link up to 19.2 kbps - if your host hardware and software can keep up.

Recently, the UoS Engineering Team received a version of KISS firmware dated "11 Dec 89". This version seems not to crash when presented with a continuous 9600 baud input stream and 9600 baud async speed. A setup running this code ran successfully for a number of hours. Unfortunately, this version of the firmware cannot keep up with the input stream unless the TNC clock rate is increased to 4 MHz. If a 2 MHz clock is used, approximately 50% of the packets on a BTTW 9600 baud downlink will be missed.

Jeff concludes: "Get KISS dated "11 Dec 89" or later, jump your TNC-2 clock rate up (using JMP2), and wait for further entertainment as we try full-duplex, full-duty cycle 9600 baud connected mode in a month or so."

[AMSAT thanks Jeff Ward G0/K8KA for the information for this bulletin]

SB SAREX @ AMSAT < W3IWI $SAREX.006
SAREX Btn #6: WA4SIR-? Call Clarification

SAREX BULLETIN SAREX.006
de W3IWI May 23,1990

Concerning the WA4SIR-? call for SAREX ROBOT operations: In the articles in the AMSAT JOURNAL and 73 MAGAZINE, it was indicated that the SAREX ROBOT would use the call WA4SIR-1 (i.e. using a SSID = 1), and in more recent SAREX @ AMSAT packet bulletins it was indicated that the call would just be just WA4SIR (i.e. SSID = 0); several people sent messages indicating that they were confused.

Both the HK21 ROBOT TNC and the operational software for the GRID laptop computer have the calls defaulted to WA4SIR (SSID = 0) and that call should

be used unless, for some unanticipated reason, the defaults are over-ridden.

The best advice is for you to MONITOR the downlink signals from STS-35 and use whatever call you see on the downlink. The ROBOT TNC code uses only one SSID at a time.

SB SAREX @ AMSAT < W3IWI $SAREX.007
SAREX Btn #7: Some comments on timers

SAREX BULLETIN SAREX.007
de W3IWI May 23,1990

This note is to give you some additional information on timers involved in sequencing ROBOT packet transmissions.

Because the WA4SIR SAREX ROBOT will be bombarded with signals from tens or hundreds of ground-based users when STS-35 is flying over populated areas, it is not possible for the ROBOT TNC and radio to use normal half-duplex packet procedures -- the CD (carrier detect) signal will simply never drop!

The ROBOT will be running in a modified full-duplex mode. When the ROBOT copies a valid packet frame (or when it is time to send a beacon), the data to be sent is put into a buffer and a timer (which we call the FUDtimer) is started. The ROBOT firmware then queues all other outgoing transmissions in the buffer until FUDtimer expires (3 seconds later), and all downlink frames in the queue are sent in one long transmission. Many who had QSOs with the SAREX demo station at the AMSAT or HEATH booths at Dayton commented on how sluggish the 3 second FUDtimer seemed to be when compared to normal packet operations.

Since the SAREX handheld radio cannot receive when it is transmitting, users should insure that they remain silent and listen when the shuttle is transmitting. In other words, DO NOT RUN FULL DUPLEX ON THE GROUND! Leave your TNC in half-duplex mode (FULLDUP OFF) with CD active just like you do for normal VHF packet operations.

However you should be careful with the setting of two of your TNC's timers -- DWAIT and FRACK. DWAIT is the time interval after your Carrier Detect light goes out and before your transmitter turns on. You want to make sure your connects requests and acks are contained in the 3 second FUDtimer window. If everybody runs the same DWAIT (like the typical 0.1 - 0.5 second values used for terrestrial packet), then everybody will be transmitting at the time. Part of the key to your success when uplink QRM is heavy is to pick a DWAIT that nobody else is using!

FRACK sets the time interval between your transmissions. After you send a frame, your TNC waits for the FRACK time, and then waits for the Carrier Detect signal to drop, then waits DWAIT, and then tries again. You should make sure your FRACK is at least 3 seconds so that you are not transmitting when the ROBOT's FUDtimer decides it is time for it to transmit -- if you are transmitting at the same time, you will miss any packets the shuttle

is addressing to you and you won't have a successful QSO.

Note that your DWAIT (how soon do I transmit?) and FRACK (then how long
do I wait?) parameters and the need to stop transmitting so you can hear
a reply are just like you encounter when working a DXpedition pileup on HF.
If the DX station has a pattern of listening for a few seconds (=FUDtimer)
before transmitting, you may have better luck being the LAST station he
hears, after the din dies down. The differences are that (1) the ROBOT
is a computer and is very predictable and (2) the ROBOT can be working
several stations at one time.

WA4SIR's SAREX mission on STS-35 is the ultimate DXpedition!

Subj: SAREX.008: NASA SETS LAUNCH DATE

SB SAREX @ AMSAT < W3IWI $SAREX.008
SAREX Btn 8: NASA Announces Launch Date

SAREX Bulletin AREX.008
de W3IWI May 24,1990

Late this afternoon NASA released the following announcement concerning
next week's launch of the Shuttle Columbia with WA4SIR and the SAREX
hardware:

"STS-35 FLIGHT READINESS REVIEW STATEMENT 5/24/90 5:10P.M. EDT"

NASA managers today set May 30 as the launch date for Shuttle
Mission STS-35 which will carry the Astro-1 payload into orbit.
Columbia will be launched during a window that opens at 12:38
a.m. EDT and extends for 2 1/2 hours. The mission is scheduled
to last 10 days. Landing is set for 4:24 p.m. PDT on June 8."

The May 30 at 12:38 AM EDT = 04:38z launch window is the same as was
indicated in our SAREX.005 bulletin released May 20th. That bulletin
contains the predicted Keplerian element set JSC-0011 which will apply
for a nominal launch at the time the window opens.

We plan to circulate a bulletin this weekend (probably SAREX.009) which
will contain a more detailed time-line for the SAREX activities.

SB SAREX @ AMSAT < W3IWI $SAREX.009
SAREX Btn 9: Operations Timeline

SAREX Bulletin SAREX.009
de W3IWI May 27, 1990

This table details planned events for Ron Parise, WA4SIR's SAREX activities on the STS-35 mission of the Shuttle Columbia. The tabular entries are given in both Mission Elapsed Time (MET) and UTC (GMT) time. If the launch is delayed from May 30th at 04:38z, the all UTC times should be adjusted accordingly. All times are approximate and should only be used for guidance.

In general Ron's voice opportunities for scheduled demonstrations all take place during the pre-sleep and post-sleep periods. The planned classroom demonstrations to be relayed via Australia and Brazil are denoted by the (VK) and (PY) windows. Any time Ron might choose to try general voice operation should also be during the pre- and post-sleep windows. Ron must also eat and take care of personal matters during these pre- and post-sleep periods.

SAREX ROBOT packet operations are planned for the approximately 12 hour windows between the post- and pre-sleep while Ron is on duty with the ASTRO experiments.

SAREX-2/STS-35 LAUNCH SET

HR AMSAT NEWS SERVICE BULLETIN 146.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 26, 1990
TO ALL RADIO AMATEURS BT

STS-35/SAREX-2 Planned Lift-off Set For May 30, 1990 04:38:00 UTC

This week, NASA officals informed AMSAT and the ARRL that the planned lift-off
of the Shuttle Columbia carrying the Shuttle Amateur Radio Experiment (SAREX)
is now planned for Wednesday, May 30, 1990 at 04:38:00 UTC. PLEASE NOTE: this
is Wednesday morning, 12:38 A.M. EDT in the U.S. Payload Specialist Ron

Parise (WA4SIR) will be the control station operator during the ten day mission. The SAREX payload will consist of a ROBOT packet radio station which will use the call WA4SIR. Also, Ron will be operating 2 meter FM voice when his work schedule permits. Stations wishing to connect to WA4SIR will receive a QSO number which they can use to verify their contact when they send in their QSL card. QSL'ing will be handled by the ARRL. Cards may be sent to the American Radio Relay League, 225 Main Street, Newington, CT, 06111. Please include a s.a.s.e. with your QSL card.

STS-35 PRELIMINARY ELEMENTS

HR AMSAT NEWS SERVICE BULLETIN 146.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 26, 1990
TO ALL RADIO AMATEURS BT

STS-35/SAREX-2 Preliminary Orbital Elements & Packet/Voice Frequencies

On Wednesday, May 30, 1990, 04:38:00 UTC the Shuttle Columbia is scheduled to lift-off from Cape Canaveral carrying the Shuttle Amateur Radio Experiment (SAREX). As part of the crew, Ron Parise (WA4SIR) will be aboard with the capability to work 2M FM voice and packet radio. The primary frequencies which will be used for both operations will be a simple 600 kHz repeater split of 145.550/144.950 MHz.

The following is the best set of orbital elements available at press time from NASA for the STS-35 mission.

STS-35
1 00035U 90150.24513889 .00031000 22174-3 0 110
2 00035 28.4690 148.3930 0005720 246.6067 119.6564 15.71792660 20

And the same data in the longer "AMSAT standard" format:

Satellite: STS-35
Epoch time: 90150.24513889
Element set: JSC-0011
Inclination: 28.4690 deg
RA of node: 148.3930 deg
Eccentricity: 0.0005720
Arg of perigee: 246.6067 deg
Mean anomaly: 119.6564 deg
Mean motion: 15.71792660 rev/day
Decay rate: 3.1e-04 rev/day^2
Epoch rev: 2

For updates on the orbital elements for STS-35 throughout the ten day mission, stay tuned to WA3NAN, W5RRR, W6VIO, AMSAT Nets, and ARRL bulletins.

SB ALL @ AMSAT $ANS-146.03
SAREX FREQUENCY LISTING

HR AMSAT NEWS SERVICE BULLETIN 146.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 26, 1990
TO ALL RADIO AMATEURS BT

Downlink/Uplink Frequencies to be used on Upcoming Mission

Get out your HTs and HT programming manuals. You will want to program your 2 meter FM transceivers with the following information.

Shuttle Shuttle
TX Freq RX Freq
+-
North/South 145.55 MHz 144.95 MHz *** Primary ***
American " 144.91 MHz
Frequencies " 144.97 MHz

Remainder 145.55 MHz 144.95 MHz *** Primary ***
of the World " 144.70 MHz
Frequencies " 144.75 MHz
" 144.80 MHz
" 144.85 MHz

These are the frequencies Ron Parise (WA4SIR) will use on both voice and packet. Please note that the frequencies where Ron will be listening for stations ARE DIFFERENT than the one he will transmit on. This is a very important fact to understand. Ron will transmit to earth (downlink) on a single frequency: 145.55 MHz. He will listen for stations transmitting to him (uplink) on the other frequencies listed. This "split" operation is used quite successfully by DXers when operating in an environment where large pile ups are expected.

The first pair of frequencies (noted as primary) is a standard 600 KHz split used by repeaters. This pair was selected so that communicating with SAREX could be accomplished by Hams using standard FM transceivers. If Ron finds that the receive QRM becomes unmanageable, he may listen on the alternate frequencies listed. In North America, the lower section of the FM repeater bandplan extends as high as 144.90. This is why the uplink frequencies only extend down to 144.91 MHz.

There will be no simplex operation with SAREX on either voice or packet. Although packeteers are not used to operation with a TX/RX offset, in this case, it is the only way to connect to SAREX. If you transmit on 145.55 MHz the only people who will hear you are those other Hams in your area trying to contact SAREX (You will most likely become an notorious instantly!).

There should be about 3 KHz of Doppler shift due to the orbital velocity of the Columbia spacecraft. By limiting the deviation of your transmitter to 3 KHz, Ron's receiver should have little trouble capturing your signal.

[This information was extracted from an article written by W3IWI, WA4SIR, and W3XO and published in the March 1990 issue of The AMSAT-NA Journal]

AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 146.05 FROM AMSAT HQ
SILVER SPRING, MD MAY 26, 1990
TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The best estimate of the current attitude is:

BLON = 180 and BLAT = +3 for 05 May 90

Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10's Mode-B Transponder Now Available for Use:

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude

is LON 24 deg LAT -9 deg.

[AO-10 update received from Graham Ratcliff, VK5AGR, via AO-13 beacons.]

FIFTH ANNUAL AMSAT-UK COLLOQUIUM

HR AMSAT NEWS SERVICE BULLETIN 146.06 FROM AMSAT HQ
SILVER SPRING, MD MAY 26, 1990
TO ALL RADIO AMATEURS BT

AMSAT-UK Sponsors 5th Annual Satellite Colloquium at U. of Surrey.

AMSAT-UK is sponsoring a symposium dealing with all OSCAR satellites and digital communications. With the recent launch of the MICROSATs, UOSAT D & E, and FO-20, OSCAR enthusiasts should find this year's meeting particularly interesting. Questions & Answer sessions with various Amateur Satellite and Packet experts are planned as are tours of the UoSat command station. As in years past, the University of Surrey will be the meeting place for this colloquium. The following is the "line-up" of programs planned for the week of July 26-29:

Thursday July 26th: International Satellite Day
Friday July 27th: Introductory Satellite Sessions
Saturday July 28th: Advanced Satellite Sessions/Packet
Sunday July 29th: Advanced Satellite Sessions/Packet

If you are interested in finding out more details concerning accommodations and the programs to be presented, contact:

Ron Broadbent, G3AAJ
94 Herongate Road
Wanstead Park
London E12 5EQ England

Tel: 081-989-6741
Fax: 081-989-3430 (24 Hours)

Information is also available on the DRIG BBS and the Hamnet Forum of Compuserve in Data Library 5. The file name is UKCOLL.TXT. It is in MSDOS text format. A file in Wordperfect 5.0 format, named UKCOLL.WP5, is also available in the same data library on Compuserve.

Note that the area code for AMSAT-UK has changed. To use AT&T in the United States to call AMSAT-UK replace the 081 prefix with 011-44-81. Contact your long distance carrier for their international dialing instructions.

[ANS thanks Ron Broadbent G3AAJ and Eric Cottrell WB1HBU for this bulletin]

Subj: Concerning changed BIDs

Some of us who post these bulletins onto the packet channels have been taking a lot of heat because some stations, somewhere are changing the BIDs, creating un-necessary duplication of the @AMSAT bulletins. I had complaints from Washington state, Costa Rica, Delaware, Wisconsin just today. Here is the text of a packet bulletin I have circulated about this topic:

SP SYSOP@AMSAT < W3IWI $14001_W3IWI
Concerning @AMSAT BIDs
R:900526/1826z 14001@W3IWI.MD.USA [Balto/Wash MD/DC/VA/DE] Z:21029

Concerning @AMSAT dupes and their BIDs: The @AMSAT bulletins originate (usually on weekends) on a non-amateur channel and are fanned out to regional distribution points with a standard BID like ORB-139.M or ANS-125.03. The local gateways (including KD9QB, W3IWI, N4QQ, WA4ONG) all post them with the same pre-assigned BID but with their own call as the originating station. Any you see with BIDs like 12345_W3IWI or 23456_KD9QB have been changed somewhere!

The past couple of weeks (and for the duration of the WA4SIR STS-35 flight) you have also seen some SAREX @ AMSAT bulletins with BIDs like SAREX.008 originating here at W3IWI. Occasionally (like right after a launch) you may also see some @AMSAT bulletins with "hot" news originating with non-standard BIDs, and some @AMSAT bulletins from elsewhere (like Europe and Australia) may also "leak" into the system with non-standard BIDs.

It appears that some BBS stations have their software configured to drop the original BIDs under some conditions, while others have their software configured to reassign BIDs (or MIDs=Message IDs) based on the forwarding headers in a message. It appears that AA4RE's REBBS and WA8BXN's MSYS code may have some options which may permit this to happen. No problems have been seen that could be traced to WA7MBL, W0RLI, CBBS or PRMBS BBS code.

The problem is serious -- some weeks I have seen as many as 3 or 4 copies of some @AMSAT and @ARRL bulletins make it into the system. Please review your BBS software configuration options and make sure that you are not the unwitting source of problems.

Tnx & 73 de Tom, W3IWI

In article<2341@anasaz.UUCP> Reply-To: john@anasaz.UUCP (John Moore) writes:

>The problem is that the paint apparently had a significant dielectric
>effect, screwing up the antenna. I certainly don't want to mess up
>my HF beam!

>Does anyone KNOW where to get paint with minimal effect, that can be
>applied directly to aluminum radiating surfaces? Does anyone know what
>this stuff is called, or specific brands?

I would suggest either an epoxy-polymide base paint or a polyurethane
(poly-u) commonly called by the trade name of Imron. Poly-u is rather
hazardous to your health if you happen to inhale it... like it coats
your lungs and then you die by suffocation. I won't bore you with a
lot of horror stories, but it is dangerous if you are careless, so be
careful... enough said.

Neither of these paints contain any form of lead base or anything else
that will screw up RF with the proviso of the pigment. Some colors
contain lead and WILL cause weird things to happen. We have used these
paints on aircraft antennas that operate across the spectrum (well, at
least up to about 20 Ghz) with no measured ill effects.

Commercially, ask for Imron, but be careful to study the contents of
pigmentation.

I have a Plymouth Voyager, and mounted a Larsen dual-band (2/70) antenna using the "L-bracket" on the front hood of the car (directly opposite to the van's broadcast band antenna). The coax is easy to snake into the passenger compartment through one of the firewall feedthroughs. The biggest difficulty I had was physically mounting the rig: my van has the "console" option, which doesn't leave much room for a radio. I have it mounted just over the drivers right knee, which seems to work OK (but you need to use care when mounting it to give it adequate support, and keep it insulated from the car electronics). Other hams I know have mounted theirs on the drivers chair. My only problem now is a spur created by the car electronics on 146.52 (you can pick this up quite well on caravans/voyager from quite a distance with your HT!).

One afternoon, while driving home (on an interstate toll road), I was being held up by someone driving UNDER 55 in the left lane. I flashed my lights at the driver and was ignored. I did it again and was still ignored. The third time (I avoid passing on the right since I consider it very dangerous) I was not ignored. I was flipped the bird by the passenger.

Well, that was enough so I started to go around on the right. As I drew beside the car, I noticed that the passenger noticed my strange antenna on the roof. (I have a dual bander in the car and my antenna is actually two short whips on one base in a "V" shape.) I QUICKLY reached for my microphone and started (from her visual perception) describing the car in detail. She could see I was talking on the microphone and she could see that I was looking very intently at parts of the car but she couldn't see that I didn't have the mic keyed. After "describing" the car, I backed off to "get the license number" and report that. When I dropped back, she QUICKLy moved to the right lane. She must have thought I was the cops or something.

Here in the "Nawtheast" the band opened up on Sunday afternoon for the first time. W1JR managed to work a VP9 and FY, but the W2's had a much better day, working Cuba, Uruguay and Argentina. On Monday, LU2DEK finally broke through the W2 curtain (about 55 here), as did a couple of CO2s (CB and KK). There were also reports of W7s (double hop). Yesterday afternoon was poorer, didn't hear any SA, but did work K1FJM in Miami with great signals. This is in addition to the 'normal' stateside E-skip in the evenings.

>I turned on my kenwood Th215 the other day and got no audio from the speaker.
>The earphone jack still works but I hadn't used that before the speaker died.

I have not had exactly that problem, but yesterday I had to replace the volume control on my 215 for the THIRD time. The first time was under warrenty, but not the last two. The problem is that the only mechanical support for the volume (and squelch) control is from the leads soldered to the PCB. In each case, the control developed a hairline crack in one of the leads. This time, when I replaced the control, I used a hot glue gun to add some support.

Has anyone else had this problem, or am I just lucky? One of the guys at the local ham store told me that Kenwood had this problem, as well as a problem with the PTT switch, in the 215. He said that they supposedly fixed them in the 225. Any truth to this?

As a side issue, can anyone tell me the difference between the 215 and the 225? The ads look almost identical, except that the 225 is rated for 6 watts when run from an external power supply.

The following was received from KA5FYI (Austin, Texas). I have sent a copy to a friend at the local power company:

TIPS FOR FINDING LINE NOISE

The City of Austin Electric Utility Department (397-1433) will look for and repair sources of radio noise provided the noise source can be found and that it is caused by equipment owned by the City. This process can be greatly speeded up if you perform as many of the following as possible and have a good idea of the noise source from your own investigation.

1. CHECK YOUR SHACK AND HOME FIRST

Kill the power to your house and listen on a portable receiver. Test the individual loads if necessary.

2. LOCATE THE GENERAL NEIGHBORHOOD OF NOISE

A low-frequency radio like an A.M. radio can be used to find the boundaries of a large area that is noisy.

3. WALKING DIRECTLY TO A SOURCE USING ONLY AN A.M. RADIO

Sometimes it is possible to use the null position on an A.M. portable radio and walk directly to the source. Walk in a direction that parallels the axis of the rod antenna. If noise standing-waves are present, this method will not work.

4. SWITCH TO A HIGHER FREQUENCY

The higher the frequency on which the noise can be heard, generally the nearer you are to the source and the more direct will be the radiation from the source.

5. USE A BEAM ANTENNA ON THE HIGHEST FREQUENCY POSSIBLE

If the noise can be heard on VHF (2 meters) and you have a beam antenna and a portable rig (transmitter hunters), then you are all set up to pinpoint the noise source. Even FM rigs indicate noise on their S meters. Also try your 10 meter beam antenna to find the general direction of noise.

6. FREQUENCY CHARACTERISTIC OF THE NOISE

If the noise can be herd loudly on 80 or 40 meters and very weakly on 10 meters, the noise may be blocks from you. If it is loud on all bands it is probably nearby. If it is loud on a higher frequency band like 15 meters but cannot be heard on other bands, then the noise is

radiating from a metal object resonant on that band.

7. PERIODIC NATURE OF NOISE GIVES CLUES

If the noise comes on at a given time, it is probably not power line noise; try to find the culprit by observation.

8. THE SOUND OF THE NOISE GIVES CLUES

A sharp-sounding noise that a noise-blanker handles well is probably a shunt discharge to ground (lightning arrestor or leaky insulator). This is a low-current leakage (it would blow up with high current) through a high resistance go ground. An exception to this is a sharp noise that comes from a loose ground connection. A soft buzzing sound that varies considerably with time indicates a bad connection with a relatively high current (a bad switch or connector).

9. VARIATION WITH WIND AND RAIN

If the noise stops with rain, it probably was caused by a bad switch, connector, or a very slack span of bell insulators. The rain fills the microscopic gap, thereby extinguishing the arc momentarily. On windy days a noise source may vary with the motion of the conductor in the wind. Either of these eliminates the source being a leaky lightning arrestor.

10. SLOWLY PULLING ELECTRIC GUY-WIRES YIELDS INFORMATION

If pulling hard but smoothly on a guy wire on about 2-second intervals causes the noise to drop in and out, it's time to call the Electric Utility.

11. THINK SAFETY FIRST; NOISE IS SECONDARY TO LIVING

Be careful around power lines. They can produce as much power as a dynamite explosion under a fault condition if it occurs near a substation. Do not use ladders, poles, etc. to touch any 'hot' elements. Watch for anything else that might come in contact with the line, such as a tree. Also, the noise could be caused by loose hardware hanging and touching something that has high resistance.

12. NOISE IS 99.9% CERTAINLY NOT FROM A TRANSFORMER

They self-destruct if noisy enough to be heard.

....K5GP

Hello net, I'm searching for a copy of a program which was popular in the early to mid 70's. It would take a line of characters destined for a printer and convert them to braille characters in a 2x3 pattern of periods which after multiple strike-overs could be read as braille through the back of stiff paper. An impact type printer like an old ASR 33, or IBM selectric was required, but the end result was tolerable braille output. These old printers often are sold at ham fests, I've had requests from several bind hams for software to do this type of conversion. If you have a program like this for general distribution, I'd truly enjoy a copy. Thanks.

>By the way, he applied for a change of call from the FCC citing
>that he thought it was "disgusting". He did get a new call:
>KE9VV.. humm the beginning of a exam!! ;-)))

Wow...funny this would pop up - I just worked KE9VV on 10M recently. If I'd have known about this, I would have suggested he keep KE9VD. Here's why:

Some years ago, I used to work Field Day with the La Porte, IN, club, call K9JSI. Used to be great fun, mostly because the group of guys were really nice folks - there weren't any overbearing snobs involved with the contest stuff.

At any rate, this particular FD there was quite a nice opening on 40M somewhere around, oh, I'd guess about 3AM. Stuff rolling in from about anywhere.

Upon having more or less established a frequency and becoming the center of a minor pileup, we called, once again, "QRZ - here is K9JSI" and got called by (I think this is the right call) W2SEX. Everybody in the tent laughed and the op. at the time (I was tracking dupe sheets) asked, "have you contracted, er, contacted W4VD yet?" (we had and thought it an amusing co-incidence). He said no, and immediately we heard W4VD, who was still listening to our pile-up, come back - they completed an extremely funny contest QSO and would have gone on their respective ways were it not for the relative anarchy of probably 100 stations all calling at once asking "may I contract W4VD?" and/or "we'd like some W2SEX..."

K9JSI vacated the frequency for them. :-)

Disclaimer: Not having the K9JSI log sheets available, I am *not* 100% certain about the callsigns. It *was* 3 AM, you know... :-)

Gosh, WB9JLH was one of the other fellows, but that call isn't in the database. Shows KD9FG - wonder if it is the same fellow.....

I have a Drake TR-4C (my first HF rig--purchased a year ago in November) and as it was my first rig, in learning to tune up, etc. the finals have been through some torture. Does anyone know of a good source for tubes of all kinds, especially the 6JB6s. I need three and they must be matched. Drake wants about $26 apiece (double their price a year ago!).

As an example of the wear and tear these tubes have seen, when I first got the rig, I was able to get out over 100 W on 10M. That's now down to < 25W on a good day!

On lower bands (15,20,40,80) I was able to get out over 200 and am now down to < 150W. Not too bad, really. But under 25 W doesn't cut it for me on 10M.

The Drake is capable of over 300 barefoot, so you can understand my interest in new tubes! At least now I can tune up quickly and properly, so the old finals served their purpose.

Donations will be accepted!! :-)

Thanks for your help, as usual.

I have quite a bit if Andrew Twinax (no number on it, sorry) that's 100% shielded, foam, and a center conductor of more than 1/8 inch in diameter.

The shielding looks alot more like conduit. I know it's for microwave, basically no loss, quality cable.

But, since I don't own a microwave tower and dishes, waveguides etc...and have no plans to, can I use it for regular applications? I'm not worried about the cable, the way it's designed it could be used to carry AC to the house, I just don't know the ratings of such monsters, dielectric/impedence/etc...

I can load it for 50 ohm if need be, yes, I know it would be over designing my antenna system quite a bit, but I rather use it than sell it off, if I could find someone interested in such a small quanity, when utilities buy it in 2000 foot bolts.

Ideas? (Constructive) Comments?

brian@positron.amd.com (Brian McMinn) writes:
>Is there a callsign server on the network that responds to e-mail
>requests? How recent is its database?

I have a callsign server that responds to mail requests. To access it,
send mail to callbook@sat.datapoint.com. In the body of the message,
include a line with the word "lookup" followed by one or more callsigns.

For example:

lookup n5lyt w5ifp kz5zzz

For more information, include a line with the single word "help".

The database is based on September 1989 FCC records, but does not
include club stations. U.S. callsigns only, of course. I intend to
update the database each year.

Currently, you can lookup by callsign only. I hope to add other
search criteria in the future.

I've noticed a running series of messages concerning short or odd ham calls.
Here's another. Looking through the RSGB Call Book which I bought a couple of
weeks ago at the RSGB VHF Conference, I came across a list of VHF/UHF ham
beacon stations. It lists a number of those in the US, but also a lot we don't
ever hear this side of the Pond..... one of which is --- I5I !!!!
That must hold the record as the shortest ham call.
Full details are: frequency 1296.855 MHz location Pistoia (Italy)
Grid locator JN53LL height asl 550 meters antenna 4 Mini wheels
ERP 10 W
Can you top this?
73, Bob W3OTC

I don't think that's correct. I believe the Presidential helicopter is flown
by the Marine Corps and is called Marine 1.

I tried looking this up in a couple of references that I had handy but
couldn't find anything either confirming or negating. Does anyone have a
better library?

> Tell us about this secondary market (or e-mail direct)!

Well, here we go. Several places often let you know that they have IRCS available. the W6GO list often has them, and I just saw a note a few weeks back that Joe, W3HNK, perhaps the most famous QSL manager in the US, had some. First, both ask 50 cents for an IRC, not 40.....and I believe both are out at the present. There is a guy in VE land that sells them as well, but I think he wants 55 or 60 cents each. Basically, the post office gives you 40 cents for each one....they cost 95 at the post office, thus the 'secondary' market.

I sometimes have them in 'limited' quantities of a few hundred or less, as most of the DX QSLs I get seem to have GreenStamps (i.e., $1.00 bills). Send me an email if interested.

Fred requested A-B comparison of the IsoLoop with anything else...

I'm deveoping a bicycle-mobile system, and am thus constrained to things
I can carry. My wire dipoles have thus been left out of the testing,
and I don't even want to know how a beam compares.

My A-B tests have been against a mini-dipole made out of Hustler
mobile resonators (2 for each band) and a pair of MO-4 masts. This
assembly is much more portable and packable than the IsoLoop, but
operationally, it's not so simple.

The basic trade-off is gain-bandwidth. The IsoLoop is EXTREMELY narrow,
requiring tweaking with almost every change of the VFO. Using an Icom 725,
this requires switching to CW, turning power all the way down, and sending
a carrier while watching SWR and nudging the stepper in the antenna.
Not a long process, but a bit of a nuisance... and it could very easily
be automated (derive DC from an SWR bridge and drive the stepper until
it is lowest; interpolate between band edges if using computer control
of the radio and output stepper pulses at the same time; etc).

On 20 meters, the IsoLoop receives consistently better reports -- like
the difference between 54 and 59. On 10 and 15, they seem similar, though
I seem to have better subjective penetration of the QRM with the loop
but less effort working with the mini-dipole. I've been using the loop
in horizontal (omni) mode with the coupling loop at 45 degrees.

I've been thinking of packaging options, including increasing the size
of the loop to include 40 meters (and match the solar panel array on
my trailer). But it's heavier and requires more setup effort, so in
my particular application it may not be optimal. But after this testing,
I can easily recommend the IsoLoop to anyone with limited space or
more conventional mobile needs. One big plus is that it's ALL BANDS between
14 and 30 MhZ, including 17 and 12 meters. With the other approach,
I need 7 pairs of resonators.

CHeers and 73...

>
> Tell us about this secondary market (or e-mail direct)!

I used to send $40 and a few stamps to KX6DS's QSL manager and get
100 IRCs back. I have done similarly with managers for other operations.

Often there will be ads in DX bulletins from W3HNK or somebody who
is selling recycled IRCs for $0.50. This still beats $0.95.

I have neither bought nor redeemed an IRC through the post office.
I view them as ham currency. Of course, for all I know this is
probably against the law or something. Sillier things are illegal.

Personally, I operate lots of contests and consequently get scores
of IRCs in a given year. As few cards as I ever initiate any more
(I'm too lazy), the incoming supply is adequate for me.

In Part 2 of the FCC Rules and Regulations is where allocations are made. Frequencies are allocated to services as well as call signs. It just so happens that the call signs K0A-K9Z, N0A-N9Z, and W0A-W9Z are allocated to the Amateur Service. There happens to be not policy of issuing them, but if they decided to do so, the rules are in place and they could do so w/o a rulemaking proceeding.

A variation of the pretend to run a plate trick I have used a few times, esp when I know they are listening to the radio is throw my tranmitter way out of tune, and hit the power, and sneak into the early stages of their amplifier.

It drives speakers faintly when they arn't even hooked up at all.

Also screws up my electronic ignition, set off car alarms, and pay phones seem to be made to pick up stray RF.

I know it's not a good practice, but driving behind me with your brights on isn't either.

Air Force One is any aircraft that is carrying the President
crewed by Air Force personnel. A specialized VIP Military Airlift unit
in the Air Force is responsible for this.
The helicopters are Marine Corps helicopters, and I believe
there is a specialized VIP unit within the Corps that takes care
of the helicopters. If he is in the Marines helicopters the aircraft
isn't called "Air Force One," but "Marines One."

To begin with, I must say that carrying a Motorola MX-360 - (converted to the ham bands) has it's advantages and they're not only technical. It happens to be the "Law Enforcement" industry standard and just having one on you leaves all (including Hams !) baffled as to who you are and whom you work for.
Numerous times in New York City - I've had Patrol Cars pull up to me, assuming I was a street crime unit and asked if I needed any assistance ! (This will often happen in cities too large for government agencies to know exactly who's who). Carrying other HT's such as the small Japanese go-anywhere-do-everything type don't seem to carry as much clout since they don't have much resemblance to the real thing from the standpoint of one who uses an MX3xx 8 TO 10 hours a day.
I carry a two fold wallet with my driver's license on one side and my FCC license on the other. I added a small photo of myself to the top right corner of the FCC license. Since the photo is not actually attached to the license but rather between the license and the outer plastic - I have legally not tampered with the license. The small alteration leaves the wallet looking very official with the FCC Logo standing out very nicely. The few times that I've been pulled over for traffic violations I've handed over the whole wallet when asked to show my driver's license. The fact that I'm immediately called "Sir" in every instance and have never been ticketed might say something. The radio antennas certainly give it more credibility. They don't call Feds "Untouchables" for nothing. - Assumption - is the key word here.
The last cop that stopped me in Brooklyn at 4 AM - asked me if I was aware that I had just made an illegal U-turn ? As I handed him my driver's license he caught a glimpse of the radio equipment and clearly heard the "Modat" signal transmissions (we've all heard that "Brroop- Brroop" kind of sound before somewhere...) coming from the car.
"Excuse me - why the radio ?" he asked.
"I'm monitoring Narrow-Band FM spurious emissions on the VHF spectrum officer"
he looked at the wallet again and then confided in me by admitting that he never notices that "No U-turn" sign either when he's off duty.

Well, I can say from first-hand experience that the Army helicopter
designated for presidential transport is called "Army 1". It hangs
out at Davidson Army Airfield just outside D.C. It's probably the
only Chinook in the Army inventory that doesn't drip hydraulic fluid...

Back in the late 70s the call N6V was issued as a special event call. I
think they were broadcasting SSTV pictures from Pioneer or Voyager spacecraft.
The main reason I remember it is that they were using some unusual feedline
for some of their antennas (nitrogen-filled hardline or something, it's been
too long!).

Well, RF Parts wants $93.75 for a matched set of 3 6JB6's, so I don't
think Drake's price is that unreasonable. Face it, tubes are becoming
scarcer and scarcer, and when that happens prices rise.

I have been trying for a couple of years to download readable
wefax charts using the pakrat pk-232 fax option. Up until recently,
my attempts have been limited to the Halifax transmissions, and although
I was able to generate low quality maps, much of the lettering on the
maps has been unreadable. I blamed this problem on noise, and the fact
that my antenna is not ideal (50 foot wire making turns through tree
limbs and window jams, etc). Recently, however, someone posted
information on the re-transmission of GOES wefax on the C band satellite S3-
channel 17, so I tried it (ie hooked up hf receiver to baseband out of
the satellite receiver). This signal is a strong clean signal, so I
figured there should be no problems. The maps I get from this signal are
nice clean maps, however again, the lettering (ie temperatures, pressures,
etc) seem to be too small to be readable. I am using the highest
resolution available on the PK-232 (1900+), and have tried different
aspect ratios, but it seems that the maps put out by this service are
much more detailed than those from Halifax. ?What kind of resolution is
necessary for these maps?! Has anyone (ie the original poster of this
info) produced readable maps from this service? If so, what equipment is
requirred? I assume that these maps must be the same as what comes off
the GOES, and it was my understanding the the pk-232 fax capability was
being used by people to get readable maps from this satellite. Am I
doing something wrong, or am I just expecting too much from the equipment
I have?

3235. Bypass wire on a power amp module, help needed.

Newsgroup: rec.ham-radio
Date: 1990-05-31 15:35:35 UTC
From: rfc@briar.Philips.Com
Message-ID: <97457@philabs.Philips.Com>
Source record: 11239

Last night, I tried to build a bypass wire on a power amp module I have. The module is a brick that amplifies and makes about 7W on the 440 band. Made by Motorola. I put it in a shielded box with heatsink. Works fine, except, of course, the HT driving it cannot 'hear' anything in receive mode. I had heard that a way to fix that is to measure out two lengths of coax, connect one length to the input of the module, the other to the output, and join the two lengths at the far end. Put two diodes from center to shield at the joint, one with cathode on center, the anode of the other on center. (back to back) The idea is to create shorted stubs during transmit (the high RF voltage turns the diodes on), and to give the received signals a path to travel around the module to the HT receiver. I thought that the lengths should be 1/4 wavelength (adjusted for propagation factor of the coax). I tried some HP high speed diodes, and also tried some IN914s.
Tried it, didn't work. Turn on the power to the module, then key up the HT (whose' power level is attenuated to a proper value that the module wants to see). Looking at the amp meter on the power supply, I see current draw go up. then key off the HT. current stays at the same level (indicating that the module is oscillating). Tried connecting the coax at a few different spots (like a few inches away from the module. still oscillates). One thought springs to mind, maybe oscillation happens because the input phase and output phase of the module are in phase, maybe if I insert a half wave length of coax between the module output and the spot where I connect the bypass to make it look like 180 phase might work (something to try tonight). BTW, the module worked after I removed the bypass. So, I didn't blow it up! :-)
Is this concept correct, or is there something missing, or wrong?
thanks in advance, 73 de WA2ISE

I also experienced some good sporadic-E effects (I've never seen it this good).

I watched about an hour of CKVR-TV Channel 3, Ontario, Canada, Tuesday evening.
I have a Radio Slack fringe-area TV antenna just above roof-level at my house
and the Canadian signal was interfering with the signals from Channels 2 and 4
here in the Metromess. The antenna was pointed SSW toward the D/FW antenna
farm in Cedar Hill, approximately 50 miles away, as the grackle flies (we don't
have many crows here...just those ugly grackles). All I've got to say about
the remote station is this: You Canucks get a whole lot better quality TV than
the drivel and recycled pablum we get spooned here in the States!

I live in the San Francisco Bay Area and have a friend, Mark, who is stationed at Moffett Naval Air Station near where I live. I wanted to visit him one evening at his home on the base, so he arranged to have a guest pass waiting for me at the main gate.

Upon entering the base and driving around for a while in the dark I was totally lost. All the streets looked the same with block after block of standard base housing. "Good thing I'm a ham," I thought, "I'll just bring up the autopatch and give Mark a call." I parked my car at the side of the road and stuck my whip antenna out thru the sun roof. The repeater was in use, so I waited a minute or so for a chance to break in.

Just as I was starting to make my call I noticed that it was getting brighter. Several security vehicles had converged on me and all I could see were spotlights aimed in my direction. I started to get out of my car to explain the situation. Big mistake! I was ordered to FREEZE. I felt that it might be most appropriate to keep my hands on my head. They ordered me out of the car and made me hug a tree while they frisked me. (I guess they thought I was carrying an extra battery pack.) I could now see that several weapons were trained on me.

This was a military base, not your local police and I was starting to get a little nervous. They asked me a ton of questions (it's hard to think when guns are pointed at you) and I answered as best I could. I told them that I held a valid FCC license to use my radio, but that didn't seem to matter. They had obviously captured a spy!

Fortunately a base security officer is a friend of mine and I asked my custodians to please check me out thru him. They also contacted my friend Mark and got his address. I was "escorted" to his house by a convoy of security vehicles-- front and back. The funny thing was that the lead vehicle didn't know where to go either. We would drive into the wrong parking lot and have to turn around. One lot was so small that we all had to back out. After several wrong turns we finally arrived at Mark's house and they had him identify me as his friend and take responsibility for me.

I learned my lesson... Ham radio works! If you're ever in trouble just grab your rig. Even if you don't transmit, help will arrive!

Thu May 31 12:03:12 PDT 1990

The following antique wireless radio equipment is offered for sale. This collection represents fine examples of some of the first commercially available electronic equipment available to the public. Please contact: Larry Dighera, P. O. Box 12100, Santa Ana, CA, 92712,(714) 842-2862 for details.

RADIOS:
1. Atwater Kent Model 10 "Radiodyne" breadboard. Rare model fully operational with 120V power supply, tubes, owner's manual, and Model M horn speaker. $1,000.00

2. Western Coil Model WC19 "Radiodyne" mint conditon and working. $200.00

3. R C A Radiola III and Balanced Amplifier with tubes. $200.00

4. Priess "Stright Eight" with loop antenna. $185.00

5. Grebe "Synchrophase" excelent condition. $195.00

6. Philco Model 71 "Cathedral". $285.00

7. Philco Model 90 "Cathedral". $495.00

8. Kennedy Model 20 Type 440 with tubes. $175.00

SPEAKERS:
1. Burns curved "petal" horn speaker, sounds great. $250.00

2. Western Electric Model 540-AW paper cone, works. 60.00

3. Bristol Baby Grand hard rubber horn speaker. $55.00

4. Atwater Kent Model "R", rare. $80.00

5. Sonochord paper cone with cloth front, mint, nice. $80.00

6. Music Master wooden horn speaker, nice. $130.00

7. Small Magnavox metal horn speaker, works. $65.00

MISC.
1. F. B. Myers RAC3 "Audion" triode tube new in box. $125.00

2. Tubes: '99's, 01A's,... $10.00 - $25.00

3. Rider Manual I-V Abridged $35.00

4. Rider Manual II $30.00

5. Books ... Fine historical colletcion. Offers accepted.

>>day long! The 6-meter guys were going nutz with working rare grid
>>squares, too.

This one made it up to central VE6 as well. We began to get suspicious after hearing FM BCST stations from San Francisco, Dallas, and somewhere in the southeastern US all fight over the same frequency.

I managed to dash home and fire up the TS-680, but it wasn't too happy to load up my HF dipole :-(I managed to pick up 5 or 6 W6's on CW, however we had a *very* high noise level. Oh well ...

The openings occured on Monday and Tuesday between 1400 and 1630 MDT. Nothing's been heard here since then.

A solid tone of (I forgot the frequency) for 30 seconds. My understanding is that 'most' of the ebs recievers trigger on 15 seconds of continuous tone.

Sorry that I don't know the exact freq. Seems to me that I had to know it when I took the 3rd class test years ago, see if you can find an old 3rd class Radiotelephone license study manual (you don't need a 3rd class license anymore, so there will be no new manuals :-), they should have the freqs there.

BTW, it used to be 15 seconds (or more or less, I forget) of no carrier, followed by 15 seconds of silent carrier, followed by 30 seconds of tone. (I'm pretty fuzzy on this, it has been a LONG time) It was pretty exciting to be sitting there working the station and have that doggone EBS monitor go off on you. Just about enough to send you through the ceiling, as you got the last 15 seconds of alert tone at FULL VOLUME. Now they only do the 30 seconds of tone.

(I ran an AM station for a few months while in Jr. college, years ago...)

If they would use them, it might be nice to let them be chosen only by extras who had had amateur (extra class) licenses for some long continuous period, like 25 years or more.

There is a great difficulty in choosing a method which is somewhat fair, and I think this method is fair, and it would also be possible to make sure that the demand didn't exceed the supply by making the long continuous period long enough.

Also, I think you might have overlooked, K0-K9, N0-N9, W0-W9, and AA0-AL9.

I think special call signs such as these should be reserved for those
hams who have in some technical way advanced the state of the art.
There'd be damned few qualified applicants.

Let's start rewarding quality instead of quantity, eh?

Actually, it's more likely to have been MARINE-ONE... it's only AF-1 if it's an Air Force Aircraft. the Helios used by the President are usually Marine Corps Aircraft. Same thing applies to Navy-1, Coast Guard-1, etc.

Seems reasonable, although I'd think I'd rather hold them for things
like special events and such.

We could also have a super class requiring an EE dissertion and 40 WPM
and them have them.

> There is a great difficulty in choosing a method which is somewhat fair,
> and I think this method is fair, and it would also be possible to make

No matter what system might be considered, it would be very important for
the FCC to recycle the calls.

> Also, I think you might have overlooked, K0-K9, N0-N9, W0-W9, and
> AA0-AL9.

I believe these were aallocated to something else. They definitely were
not allocated to the amateur service.

An EDUCATIONAL EXCHANGE OPPORTUNITY for teachers & kids worldwide!

In commemoration of the 130th anniversary of the PONY EXPRESS a group of riders will be making a venture from the wild west marking the original route of the HISTORIC MAIL RUN.

I received a call yesterday from the ST. JOSEPH MISSOURI PONY EXPRESS MUSEUM that four of the courageous riders will be from CZECHOSLOVAKIA representing their enthusiastic chapter of the INTERNATIONAL PONY EXPRESS ASSOCIATION. Braving some of the original trail on horseback that was covered by young riders long ago the contingent intends to visit SUTTER'S FORT and the PONY EXPRESS STATUE in OLD SACRAMENTO on FRIDAY, JUNE 1ST 1990.

As Sacramento readies for - RAILFAIR '91 - we are reminded of our history and the important parts in communication that the PONY EXPRESS, the TELEGRAPH, and the RAILROAD INDUSTRY each played in it. I have invited this group to visit the COMMUNICATIONS MUSEUM in the historic CALIFORNIA SUPREME COURT BUILDING where we will be wishing them well on their journey and passing "mail" to them of greetings to the CHILDREN of ST. JOSEPH and CZECHOSLOVAKIA on the occasion of their trip and the SACRAMENTO CHILDREN'S FESTIVAL this weekend.

ANY EDUCATORS who would care to join us in congratulating them further on the completion of the journey - June 17th - are invited to forward joint or individual (batch) messages from their students either to me via ELECTRONIC MAIL _or_ TO THE ST. JOSEPH MUSEUM DIRECTLY BY LETTER to meet the group at trail's end at the following address:

Scott Koch, museum display technician
St. Joseph Museum
11th & Charles
St. Joseph, MO 64501

- note: -

At this time we have no address for receipt of Email in St. Joseph or along the historic route. If any users are aware of an Email address of an educator, member of the INTERNATIONAL PONY EXPRESS ASSOCIATION or chapter of the AMERICAN RADIO RELAY LEAGUE along the route or in St. Joseph that might enjoy helping out please contact. (Individual expressions of international goodwill and peace would also be welcome of course.)

I'll post updates as they are known.

Please consider joining this effort.

This is of general interest to most radio radio oriented hobbies so
I made it a public response.

RF PARTS
1320 #16 Grand Ave.
San Marcos, CA 92069
(619) 744-0728

They carry mainly RF Transistors, have a good slection of common RF tubes,
and can usally special order anything they don't have sitting on the shelf.

They carry tubes from the small 6X4 to the monster amp eater 4CX5000A.

Some books, related equipment and parts. They are part of what is left of
Palomar, which basically has split into two divisions, the RF Parts, and a
local retail store mainly dealing in CB/10 METER (although they carry other
bands, this is what they seem to be geared for...)

I'm not affiliated with them, or anything along those lines, but they have
kept me as a satisfied customer so far.

The only `prefix-only' call I'm aware of is, of course, King Hussein, JY1.
Are there any others? His wife is JY1?? and King Juan Carlos of Spain has
his own prefix and his initials as his suffix, EA0JC, but I think he's the
only one sans suffix.

73, jim ky2d

This past Memorial Day, I was coming home on the NYS Thruway and was
talking to N2ERX. John said he was using a Un-tanna. It was only
5" tall (or short!). It had a diameter of about 7". He uses it on
the trunk of his new car; it has a mag mount and a trunk lip mount.

He also said that it rates as well as, and sometimes better, than
the Larsen he also has (I cannot remember if he said a 1/4 wave or
a 5/8th wave Larson).

He said he picked it up at one of the areas hamfests. But he did say
that it was made in Buffalo, NY. Maybe someone else here has more info.

This one came up on rec.aviation a while back.

Whenever the President is aboard a military aircraft, that aircraft uses
the callsign [service] One. The 707 is operated by the Air Force, and
that helicopter is operated by the Marines; if he was to use a Navy C-2
Greyhound (AKA COD) to get to a carrier at sea, that would be Navy One,
etcetera.

>
>I tried looking this up in a couple of references that I had handy but
>couldn't find anything either confirming or negating. Does anyone have a
>better library?

Experience. From the ATC point of view, the helicopter is called Marine-1,
the plane is called AF-1. However the crew and support staff usually
referred to the plane as 26000 (2-6-thousand) or 27000. These numbers refer
to the tail numbers of the planes. One is the real plane, the other is the
back up (This info is two years old).

Interesting sidenote: When President Nixon resigned from office, he left
the DC area aboard AF-1 before his resignation took effect (1200 08-Aug, I
think). However, enroute, his resignation took effect and he was no longer
the President. Therefore, when he landed his plane was referred to as
AF-xxxxx, not AF-1.

I worked N6V, and later received the QSL card. It was for Nasa6Viking,
the 6 being ostensibly for 1976. Nice QSL, folded out, and showed the
descent to Mars.

My all-time favorite though, was NU3DE. It was a nudist colony in
Crownsville Md. And, yes, I did get the QSL from this one too! The
operator was Phil, and the front features a family around the ham
rig. This one was from the late 70's also. The FCC was more
amenable to special event stations back then.

While driving home from work yesterday I had the FM radio on in the car. The band was open a little and I was hearing the usual unusual stations down by Corpus Christi and so forth. Then I hit the "seek" button on the radio and it stopped on 107.something and I heard some kind of Q5 screaming redneck truck dealer selling his wares, "Yeah. We got trucks. All kinda trucks. Big trucks. Little trucks. Pre-owned trucks" (I love that expression "pre-owned") and I was thinking the band must be open toward Beaumont someplace. "We got a great deal on a 1986 F-150. A real beauty. Low mileage. Only $4995!!!! Just take the blah-blah-blah exit off of I-95 and go east." I-95???? "That's at Biscayne (or whatever it was) Ford Truck.

Pretty neat.

Hi All!
Since my new Tech license allows me full privileges on the vhf bands
I have decided to buy an HT to play with. I have been reading with interest
all the recommendations for the various HTs available, but so far I have
not seen anyone mention Alinco's equipment. Their stuff seems competively
priced (plus their HTs look good :-)). Is it any good?

Last night I was listening on my receiver to someone on 2m who said he was
working through two repeaters. Maybe I misheard, but if I didn't, does this
mean that the output frequency of one repeater is on the input of another?
Would this mean that every time the first repeater was used, the second would
also be operated?

>.....I agree....

From a vaguely recalled article (maybe in Smithsonian?): [service]1 is
the call used by an aircraft _with_ _the_ _president_ _on_ _board_. The usual
White House shuttle is a Marine chopper, hence, Marine 1. There exists an
Army 1. When the same a/c does not have the president on board, it has a
conventional callsign (forgotten...). If one of the back up planes is in use,
by the president, _it_ assumes the [service]1 callsign. They recounted Nixon
flying to California after resigning. Someplace in midcontinent, the a/c
stopped answering Air_Force1 and started using a conventional call.

>Air Force 1 is any aircraft carryin the president ... thus the helicopter
>for that short trip was AF-1 ....

I don't think so; it's true that there are (currently) several aircraft, converted 707s, which can be Air Force One when the President is aboard. However, I seem to recall that the helicopters used by the President are NOT Air Force craft, and are called either Marine One or Army One (I don't recall which service operates the 'copters) when the Chief is aboard.

3278. TS-140S TX All Freq Mod

Newsgroup: rec.ham-radio
Date: 1990-06-01 18:43:04 UTC
From: POPYACK@TOPS20.RADC.AF.MIL
Message-ID: <12594388639.10.POPYACK@TOPS20.RADC.AF.MIL>
Source record: 11268

To enable the TS-140S ofor transmitting on all bands:

1. Disconnect radio from power supply and antenna
2. Remove top and Bottom covers
3. Locate the control board (I believe it is on the bottom --NOT BEHIND TH
THE KNOBS LIKE THE 440!!)
4. Cut D31 on the control board
5. Reassemble the radio
6. Reset the radio by holding the A=B switch while powering up the rig.

Disclaimer: This Modification is for those who need it to operate MARS only.

I would think that you'd have no problems using this cable IF you can manage to obtain and use the necessary connectors. By the way, you should be able to figure out the characteristic impedance using the following formula:

Z = 138*(1/SQRT(K))*log (D/d)
10

where D is the inner diameter of the outer conductor (shield), d is the outer diameter of the inner conductor, and K is the dielectric constant of the insulator (foam). Typical numbers here are -

Foam polystyrene.......1.02-1.24
Teflon.................2.1
Polystyrene............2.45-4.0
Polypropylene..........3.5-3.6

Note that the dielectric constant of foamed material is *less* than that of the "unfoamed" version.

From: alanb@hpnmdla.HP.COM
Message-ID: <1250175@hpnmdla.HP.COM>
Source record: 11189

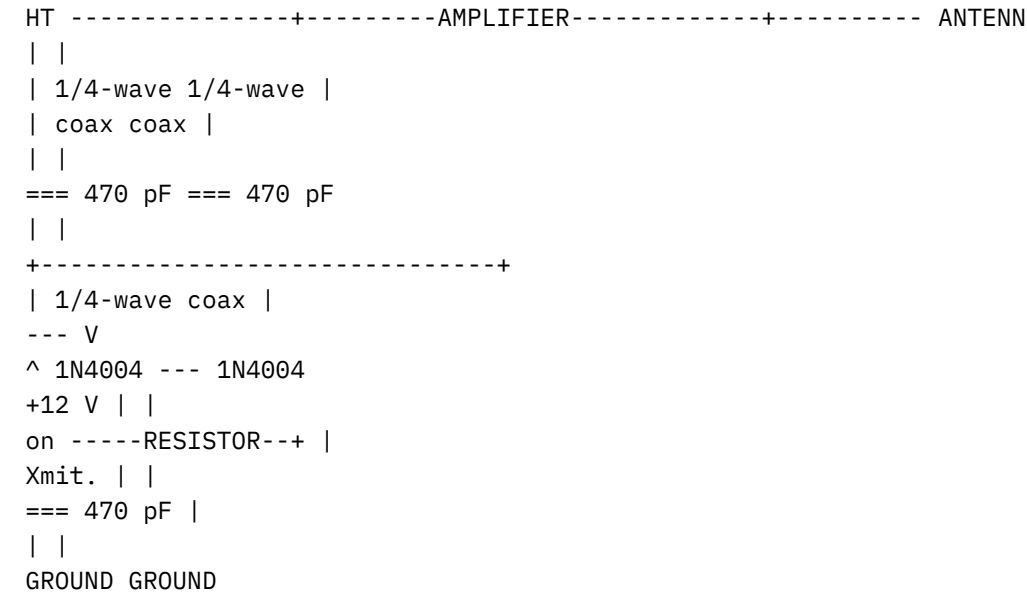
WA2ISE tried to bypass his 2 meter power amplifier (so his HT could hear on receive) by connecting a pair of 1/4-wave coaxes between input and output with a pair of back-to-back diodes shunting the junction between the two lines.

The diodes do not act as a perfect short when the high-power RF turns them on. Forward conduction voltage is .7 Volts or so peak, perhaps .5 VRMS of fundamental energy, which represents 12.5 Watts into 50 Ohms.

The amplifier will oscillate with all this feedback. In fact, you might be in danger of overdriving the amplifier input with this much power.

Messing with the phase (by changing line length) probably won't help. The phase shift of the amplifier is a strong function of frequency -- achieving negative feedback at one frequency is no guarantee that you won't have positive feedback at some other frequency.

Try replacing the switching diodes with a PIN diode, and run a high DC current through it on transmit. To get enough isolation you might need two diodes, separated by a 1/4-wave line (total of 3 lines). Some people have had success using 1N4004 power supply rectifiers as PIN diodes. Their switching time is slow enough that they work pretty well, and they have good power dissipation.



Sorry for the crude diode symbols. You may need to stick a 1 uH choke in series with the resistor to keep RF out of the +V line. Resistor value might be 120 Ohms, 2W (100 mA thru the diodes).

If the 1N4004's don't work, you might have to use real PIN diodes.

3282. Re: QSL managers

Newsgroup: rec.ham-radio
Date: 1990-06-01 19:32:56 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <9006011932.AA20091@ucsd.edu>
Source record: 11177

The latest (June '90) issue of CQ has a letter in the letters-to-the-editor column from a QSL manager about some of the problems and expenses he has, and he suggests they run an article explaining *all* the details and proper procedures for QSLs via bureaus and managers. There was no editorial response indicating that the magazine would do this, but, since there's been so much discussion here on the net about this topic, I think one of you out there could make a little money on the side by writing such an article and submitting it to CQ. I know that I didn't really understand what the problems he was complaining about really were, and I'm sure others could use clear and detailed explanations, aimed at a level starting with the very basics, and written with practical considerations in mind -- exactly what actions should the ham take, and what should the manager/bureau do, to handle all this stuff with the maximum efficiency, speediest turnaround, and minimum cost (to *all* concerned).

(If anyone out there does this, do it on-line, and send the list an electronic copy of the article so we can compare it with the edited version that eventually gets published. So many people claim magazine editors mangle their submissions that it would be informative to have a chance to see the "before and after" of such an exercise.)

Regards, Will

Reguarding the burger place....

While I'm in the mobile, I'm usally yacking at my pal who lives about 2 blocks from me, and when I get to the window, the girl usally has a goofy look on her face. I have an AS 927 antenna, which is pretty fine, and un-noticible, esp from the angle of her position at the driveup window.

I ask her, "What's wrong?" not realizing I'm bleeding over again, to which she replied "Something strange is happening..."

Then I realize what happened, and pick up the mike, turn it up all the way, and said to look for Rod Sterling, she turned around as I was still keyed up...

"THAT'S SOOooo WIERD!!"

I now play little mind games with them, mumble something like Cancel the order, and I'd like a orange drink instead, when there's no one at the intercom...

I don't know if this counts, but..

I used to hang around with a group of hams who ran several repeaters in town (BTW, are there any other old Gridd Radio Network people here besides myself?). They all seemed to have PA's in their cars, too.

Anyway, the local county government used to have a tape message for rat control that sounded like a friendly phone conversation. The voice was something like an older gentleman, slightly gravelly, and he said something like this:

"Hey there! How're ya doing? Oh, everybody's fine. Except we've got this problem. Yeah, rats. There all over the place. In the basement, in the cupboards. One of them almost bit the baby! Scared the wife half to death. Yeah, I'm going to call the Monroe County Pest Control Board at XXX-YYYY. They'll be ablt to help me.

"Uh-oh, gotta go. One of them's trying to chew up the phone cord. Get outta there!"

We would go to our favorite restaurant/hangout, dial this up on the autopatch on one of the repeaters, and pump it out the PA. Then we'd go in and hang around for a few hours, eat, and gab.

Gawd, it's been years now...

Hello all,
I am looking to get into satellite and I have found (but not yet aquired)
a KLM 435-40CX, KLM 2M-22C and a Kenpro KR500 Elevation rotor...

What I need is feedback about each of these. I am just starting out so
any feed back would be great!

I have heard that these may have too narrow beamwidth and this may make
tracking satellites difficult, can any one comment on this?

I have also heard that if you do not have the space you can remove one
section (the end director) and you can shorten the antenna from 19 ft
to about 15 feet. While this affects gain a little the antenna is still
supposed to perform as well as antennas of this size.

Thanks inadvance folks...

Paul, the HST PI's have exclusive access to HST data for a year after it's acquisition I believe. This is inline with NASA policy for spacecraft data. This is the reason that no images of the voyager Neptune encounter (except those digitized from NASA Select video by Stanford) have been released to the public (except for press photos). If the PI's choose to release data early, I guess this could be made available.

This is designed to protect scientists who may have waited years for their experiment to fly, and not allow some 3rd party to quickly analyze the data and publish before the PI can. I think this is reasonable, but it certainly can be frustrating. Perhaps it would be possible to get some low resolution bitmaps of press photos released to the public.

Thanks,
Milo

PS Usual disclaimers about this not representing NASA or Government policies or positions apple of course.

It would certainly not be a good thing for their network
connection and whatever machine hosted the images, as it would rapidly
be swamped under hundreds to thousands of connections. Using the
Internet to copy large images merely to satisfy people's curiosity
and/or give them more background bitmaps is not wise.

Except that A1 is not a valid US prefix. US only owns AA-AL. In fact, a quick
glance at my ITU allocation table shows that no ?1 prefix blocks are assigned,
except for the countries that own entire first letters (F,G,K,etc.)

Too bad U.K. owns MAA-MZZ. The USSR could have used M1R instead of U1MIR!

With few exceptions (in which cases, the card can become invalid for things like DXCC - I have a TI9 card that is of this variety - the operator was 'obviously' padding his pocket), the manager does not request more than the cost of returning the card. In fact, consider that, if one sends a manager a SASE with his/her card, then the manager AUTOMATICALLY is out some money due to QSL card printing. Admittedly that isn't much, but when you get something in excess of 500 cards per month (as I do), it adds up. Add to that the cost of replying to bureau replies (the envelopes at the bureau, postage and cost to send back thru the buro, etc...) NOT TO MENTION THE TIME!, QSL managing isn't a profitable situation. (Note...some managers DO NOT reply to bureau cards, but there is increased pressure from various ham organizations to do so).

The folks that send a greenstamp for return postage without being required to do so are essentially 'donating' to the QSL manager's war chest. I think your point is interesting, but unless required, the money sent above and beyond the cost of returning a QSL is usually an attempt on that ham's part to keep the Manager from LOSING any more money, rather than 'padding his/her wallet'. As mentioned earlier, of all the DX stations I QSL for, the balance runs positive for only one, that because he is extremely rare, and does some 1000+ contacts a month, often on rare modes (VHF, Satellite, RTTY, etc). The balance is kept near '0' by sending equipment to further these operations. I am more comfortable doing this than 'pocketing' the change, but this decision is my own. I suspect, having been in this arena for some time, that managers are not a profitable function. If you doubt it, try being one sometime!

This is O.K.

>Forward conduction voltage is .7 Volts or so peak, perhaps .5 VRMS of
>fundamental energy, which represents 12.5 Watts into 50 Ohms.

??? What does this mean??? =============^^^^^^^^^^^^^^^^^^^^

Suppose you wished to have a shunting impedance of 1 ohm, I=.5/1 = .5 Ampere.
Power = .5 VRMS *.5 A = .25 Watt!!! [This might be a problem for the amp!]
For 10 Ohms, The Power in the diode is .025 Watt.
It's real hard for me to imagine a 12.5 Watt, 25 Amp signal diode for .02 Ohm.
You can't have meant that!

Since the impedance of the diodes determine the "I" in the above equation,
and the impedance of the diode is driven by the applied voltage and current
it cannot be explaned so simply. Still, I agree there is very little current
in these diodes. As you might guess from the size of the diode packages used
in these circuits.

>The amplifier will oscillate with all this feedback. In fact, you might be in
>danger of overdriving the amplifier input with this much power.

Probably, NOT the real culprit!

BUT,,, Your missing the point of the 1/4 wave transmission line transformers.
Imagine a Smith Chart...
The diodes receive enough energy (RF) to conduct from the amplifier.
Ths energy is about .5 volt at a small current. Why???
Well it's the magic of the transformer. The low impedance presented by the
diodes to the end of the 1/4 wave line is transformed to a very high impedance
at the amplifier. The amount of energy actually getting to the diodes is
controlled by how accurate the 1/4 wave lines are, and how good the diodes are.
I don't have a chart here, but I seen to remember that 1 ohm shunt get you
well over 2500 ohms at the other end of the cable. Assuming a loss-less

transformer, the amount of power that can couple into a >2500 ohm load from a 50 Ohm source is what will arrive at the diodes. But nothing like 12.5 Watts. And we haven't even begun to consider the non-resistive effects of the diodes.

I have built many of these solid state RF switches for "brick" power amps. The real problem is how good (bandwidth) the coax 1/4 wave line is. What is really needed is a 1/4 wave transformer that only works over "our" band of frequencies. Alas! Reality strikes! As frequency departs from the band of interest, the transformer action produces a very different result. Where the amplifier's gain bandwidth is greater than our desired switch, enough energy at (typically) lower frequencies now passes unhindered (except possibly by diode clipping) to the amplifier's input. (Check and see if your amp is an oscilator at a frequency other than in the band of choice! If so, there's your problem!)

The other thing not mentioned, is the necessity of dual diodes at the input and output of the amp. These are to isolate the 50 ohm "load" of the unpowered amplifier from robbing your incoming receive signal. These diodes will not see enough voltage to conduct and therefore represent an open circuit to the receive signals.

>Messing with the phase (by changing line length) probably won't help. The phase
>shift of the amplifier is a strong function of frequency -- achieving negative
>feedback at one frequency is no guarantee that you won't have positive feedback
>at some other frequency.

Attempting a "phase change" by varying line length is a BAD idea! First look up how much line you need to even vary the phase 10 degrees! But far more important is the implication of what you are doing to the 1/4 wave transformer. Phase changes end up being made with LOTS of coax and must ALWAYS arrive at odd wave lengths, E.I 1/4, 3/4, 1 1/4, etc.

>Al N1AL

Again, NO FLAME INTENDED, I might be missing something here, but this is my experience and sense of what is happening.

Sad, but true. VGA quality GIFs run about 300kB per shot, and the combination
of disk saturation and network saturation usually dooms most image sites.

It should be posible for one of the T1 - based NSFNet sites to carry the
images, on something like a NET based pc with lots of scsi disk (ala grape).
Once the PI exclusion period is over, maybe this will be a possibility.

True, but instead of runs of 1s or 0s causing absence of clocking, the user
data pattern must be a long pseudo-random sequence with just the right
phase. This is MUCH less likely in practice. That's why scrambling is still
a very useful and widespread practice.

>> are used for SPACE stations... so, STS-35 could be assigned A1A, and be in
>> line with the normal callsign assigning rules.

Even if this is true (I don't know) I doubt they'll be used any time soon.
All of the ham-in-space operations have used the existing callsign of the
astronaut (even though they've all gotten waivers of the Extra Class
requirement) and all of the US-licensed Oscars have also used the existing
callsigns of their licensees. And because space stations are exempted from
ID requirements, most of you don't even know what these callsigns are,
I bet...

Phil

3303. Re: shortest ham call

Newsgroup: rec.ham-radio
Date: 1990-06-03 10:27:33 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9006031027.AA18911@cmr.ncsl.nist.gov>
Source record: 11211

Jim Docke, WB2HBZ, has sent me a message claiming a tie for shortest ham call between my candidate (I5I) and King Hussein (JY1).

I calim to still be winning (on CW), since I5I is just two "dits" away from the shortest possible "letter-number-letter" call - E5E.

73, Bob W3OTC

Ah, the serious technical matters discussed in this group !

3304. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-06-03 14:56:44 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9006031605.AA00855@ucsd.edu>
Source record: 11209

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

3305. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-06-03 14:57:13 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9006031605.AA00817@ucsd.edu>
Source record: 11210

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

3306. Re: Satellite antenna help?

Newsgroup: rec.ham-radio
Date: 1990-06-03 17:08:06 UTC
From: wordy@cup.portal.com
Message-ID: <30490@cup.portal.com>
Source record: 11212

Phil KJ6NN asked about comments on the KLM satellite antennas....

They work fine, and beamwidth is about 25-30 degrees effectively
(at least on my shortened model, probably less on the full size units).
This is by no means too narrow, especially since you will be using
an Az-El tracker. Actually, with Oscar 13, you can set it and forget
it for an hour or so during the good part of the orbit, as long as
you use something like Instant-Track to point it in the first place.
During my early bicycle-mobile satellite experiments, I had no
trouble pointing using only a compass and an eyeball (pedaling with
the things attached was another matter entirely, and caused great
guffaws from passers-by, snagged tree limbs, and a bit too much
instability for comfort).

Tracking microsats or other low-orbit birds is considerably more
challenging, and does require active control on the part of your
computer. And in the case of Microsats, a well-designed omni system
(like the stacked J-poles described by Dick Jansson in a recent
AMSAT news) should work almost as well.

Best of luck, and see you on the birds....

>Has anyone figured out the format of the multi-level fax
>format for RS232 from the MFJ1278. The documentation indicates that
>the lower 6 bits of each character represent 3 2-bit pixels. However,
>as far as I can tell (using a signal generator), individual pixels
>are meaningless - only the average 6-bit values are real.
>Does anyone know?

If you have the latest ROM Rev, you should have 8 level capability as well as 4 level. MULTIFAX should be ON, 8LEVEL should be ON. The pixels are packed two to a byte, and 40H is added to the byte to make it printable ASCII. WEFAX comes out to 607.5 pixels per line; I usually just drop a pixel every other line.

If you don't have the documentation on this, call or write MFJ.

3308. Ford Taurus HF Mobile question

Newsgroup: rec.ham-radio
Date: 1990-06-03 21:00:03 UTC
From: summers@hpspkla.spk.hp.com
Message-ID: <4630013@hpspkla.spk.hp.com>
Source record: 11213

I am thinking about trying HF mobile operation from my 1987 Ford Taurus sedan. I would like to hear from anyone who has successfully (or otherwise) attempted this. Several specific questions I have are:

1. What type of antenna system (mounting) did you use?

2. I intend to operate with output powers of about 100 watts PEP. Did you experience any problems with the electronic control system (fuel injection, cruise control, etc) caused by the transmitted RF? If so were you able to remedy the problems?

3. Is there any noise generated by the Taurus that a good quality noise blanker would have trouble with at HF? If so, any effective fixes?

My current plans are to try to get some sort of an antenna mount built for a hustler mobile antenna (which I already have) that would bolt to the frame similar to a trailer hitch. What ever I do I have to get it done in less than a month (trip planned) so I am hoping to get a jump on any problems by asking for any experiences out in net-land. Thanks in advance for any responses.

Jim Summers, KD7F

3309. EBS Nuclear Announcement

Newsgroup: rec.ham-radio
Date: 1990-06-03 23:33:47 UTC
From: TCOMGRD1@OUACCVMB.BITNET
Message-ID: <9006032356.AA15701@ucsd.edu>
Source record: 11214

Date: 3 June 1990, 19:22:11 EDT
From: TCOMGRD1 at OUACCVMB
To: INFO-HAMS@WSMR-SIMTEL20.ARMY.MIL at MIL

About the EBS (Emergency Broadcast Network)....

I worked at out campus staion fall quarter (semester) [WOUB/WOUC -- Athens (ch 20) and Cambridge (ch 44?) in Ohio]. We had the EBS button right there by the Duty Directors console (the guy who does the on-air switching of programs) as well as the audio carts (commonly used in radio for commercials. We use them with slides for quick voice-overs and to fill space when satellite shows end early) for the EBS. There were 2 carts, bright flourscent orange, marked something to the effect of: EBS (0:30min [30secs]) xx/xx/xx [date] Male Voice. "Thermonuclear Announcement". I asked what the heck they were, and was told that they (one male voice and one female voice) were the tapes to be played in event of Nuclear War. Ever curious, I asked what they said. No one knows. It seems only the station manager has ever heard them, and he decided that they are potentially too stress provoking to let anyone else hear.
Some of the DD's there said they dont want to know what they say... but I still want to know, heck, if yer nuked your nuked.... what doesit matter if you know the announcemnt ahead of time! I asked some more authoritative people at the station if i could listen to one of the "carts" in an isolated room sometime and was told "No.".

Does anyone out there know what these say? If so could you email me what is says, or is that illegal somehow?? WHATEVER YOU DO... Dont reply with the actual message to the net!!!!!

In article <1375@yenta.alb.nm.us>, dt@yenta.alb.nm.us (David B. Thomas) writes:
> I used to have a cb in my car, and it came over the intercom at a local
> burger joint perfectly. My 'neat ham trick' was to go and order my burger,
> get my order number ("We'll call number 21 when that's ready") then go back
> to the CB and transmit "Number 20, your order is ready", and watch the fun!

Reminds me of a story....

Don Wallace, W6AM, had a KW rig in his convertable back in the early 1950s.
According to an item I read in an old magazine (CQ? QST?) he used to drop
his wife off at a department store in LA for shopping, and then drive off
and visit a ham store or do some hamming.

The killowatt transmitter got into the store's PA system very nicely on
AM (I don't recall the band). When Don was ready to pick her up, he
would pull up in front of the store and announce, "WILL MRS DON WALLACE
PLEASE COME TO THE FRONT OF THE STORE".

3311. AMSAT Bulletins for 6/2/90

Newsgroup: rec.ham-radio
Date: 1990-06-04 02:21:46 UTC
From: tad@ssc.UUCP
Message-ID: <801@ssc.UUCP>
Source record: 11217

KA9Q used to post AMSAT bulletins on a regular basis. Awhile back I wrote to him and asked if he was going to continue doing it, and he said he was too busy. To get them on the local packet network, I have been calling the BBS in Texas every weekend where they are posted (214/394-7438) and downloading them. From now on I will post them here. I have made some minor changes to clean them up for packet, such as limiting titles to 30 characters, line length to less than 79 characters, and running them through a spelling checker (there seem to be 3 or 4 minor misspellings per week).

I encourage anyone who is on VHF packet to download them from the BBS, or get them here, and upload them to packet. BE SURE to preserve the bulletin IDs (BID$) so that we don't have multiple copies running around the packet network. This should help fill in some of the holes in distribution around the country.

WO-18 STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 153.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

WO-18 CCD Camera Iris Settings Experiments

For the past several weeks WEBERSAT-OSCAR-18 (WO-18) has been sending three to four pictures daily from outer-space. This continuous stream of imaging data has been part of an on going experiment by the students at Weber State University (WSU) to characterize the amount of natural light which enters the CCD camera for the various iris settings. The goal of this experiment is to find the proper settings for the camera iris for a particular light level. This will help considerably in improving the overall picture quality. With the integration of the on-board earth's sensors in the current software, the occurrence of over exposed pictures or totally dark pictures taken when WO-18 isn't earth pointing is no longer a problem. Chris Williams (WA3PSD) says that the painstaking task of manually setting

the iris from the ground and observing the results will help software engineers in the future as they continue to understand the CCD camera operation. "The early days of random picture taking are gone," according to WA3PSD. There are 256 possible settings which ground controllers can command the camera iris to; a "zero" setting has the iris completely closed, a "255" setting has it wide open.

What will ultimately come out of this experiment is a look-up table in WO-18's software which will say "for this light level, use this iris setting."

For those wishing to take part in this experiment, WeberWare 1.0 is currently available from the AMSAT Software Exchange. Contact the Exchange at (301) 589-6062 for further information.

WEBERWARE 1.0 USER QUESTIONS

HR AMSAT NEWS SERVICE BULLETIN 153.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

Most Asked Questions About WeberWare 1.0

WeberWare 1.0 is a software program for IBM PCs and clones which will take raw packets from WO-18 and turn the packets into pictures on EGA/VGA CRT screens.

Recently, as more amateurs start to use WeberWare 1.0, the following questions are being asked of AMSAT Area Coordinators about its use:

"Does the TNC [automatically] go into KISS Mode?"
The answer to this no. You must command your TNC into KISS mode by typing: KISS ON. After this, the TNC must be RESTARTed or turned off and back on so that it will actually start to operate in KISS mode.

"How do you store the files? As ASCII"
The picture data from WO-18 comes down as raw binary data, that is, it is not displayable as ASCII characters. As the data is received, your communications program must store the binary packets in a file. Do not be concerned about ASCII telemetry frames which occasionally come down along with the binary packets. WeberWare 1.0 ignores the ASCII telemetry.

"How do you upload a picture to WeberWare 1.0?"
When you store the data from a WO-18 pass, name the file so that its file extension has a ".RAW" and put the file in the same directory in which WeberWare 1.0 resides. After you have invoked WeberWare 1.0 and the main menu comes up, you will see an option for "PACKETS TO PIXELS." Upon choosing that option, WeberWare will give you a choice of all files that have file extensions ".RAW"

Chris Williams (WA3PSD) of Weber State University (WSU) points out that a complete picture file will take up about 156 Kbytes in a disk file. According to Chris, one can quickly start to run out of hard disk space in a HURRY!

NOMINATIONS FOR AMSAT-NA BOD

HR AMSAT NEWS SERVICE BULLETIN 153.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

Nominations Period for Three Seats on AMSAT-NA BOD to Close Soon

Nominations are sought for the AMSAT Board of Directors. Directors are elected by the membership for two-year terms. Any member society or group of five members can nominate someone (a member) to run for the position.

This year there are three seats to be filled. Those directors whose seats are up for election are Phil Karn, KA9Q, Tom Clark, W3IWI, and the seat vacated by the resignation of Vern Riportella, WA2LQQ.

All nominations should be sent to AMSAT BoD Nominations, 850 Sligo Ave #600, Silver Spring, MD 20910 to arrive no later than June 15, 1990.

SAREX PACKET HINTS (PART-1)

HR AMSAT NEWS SERVICE BULLETIN 153.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

You learn very quickly when venturing into the world of Packet Radio that unless you use the correct call sign when attempting to connect to another packet station, you won't get too far. Such is the case with the packet operation on SAREX. A number of publications reported earlier this year that the SSID for the SAREX packet ROBOT would be = 1 (ie: WA4SIR-1). Tom Clark, W3IWI, reports that both the HK21 ROBOT TNC and the operational software for the GRID laptop computer have the calls defaulted to WA4SIR (SSID = 0) and that call should be used unless, for some unanticipated reason, the defaults are overridden. Tom continues, the best advice is for you to MONITOR the downlink signals from STS-35 and use whatever call you see on the downlink. The ROBOT TNC code uses only one SSID at a time.

Because the WA4SIR SAREX ROBOT will be bombarded with signals from tens or hundreds of ground-based users when STS-35 is flying over populated areas, it is not possible for the ROBOT TNC and radio to use normal half-duplex packet procedures -- the CD (carrier detect) signal will simply never drop! The ROBOT will be running in a modified full-duplex mode. When the ROBOT copies a valid packet frame (or when it is time to send a beacon), the data to be sent is put into a buffer and a timer (which is called the FUDtimer) is started. The ROBOT firmware then queues all other outgoing transmissions in the buffer until FUDtimer expires (3 seconds later), and all downlink frames in the queue are sent in one long transmission. You may discover

that the response time while running in this mode is sluggish when compared to normal packet operation.

Since the SAREX handheld radio cannot receive when it is transmitting, users should insure that they remain silent and listen when the shuttle is transmitting. In other words, DO NOT RUN FULL DUPLEX ON THE GROUND! Leave your TNC in half-duplex mode (FULLDUP OFF) with CD active just like you do for normal VHF packet operations.

SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

You should be careful with the setting of two of your TNC's timers: DWAIT and FRACK. DWAIT is the time interval after your Carrier Detect light goes out and before your transmitter turns on. You want to make sure your connects requests and acks are contained in the 3 second FUDtimer window. If everybody runs the same DWAIT (like the typical 0.1 - 0.5 second values used for terrestrial packet), then everybody will be transmitting at the same time. Part of the key to your success when uplink QRM is heavy is to pick a DWAIT that nobody else is using! (sort of like picking a lottery number!)

FRACK sets the time interval between your transmissions. After you send a frame, your TNC waits for the FRACK time, and then waits for the Carrier Detect signal to drop, then waits DWAIT, and then tries again. You should make sure your FRACK is at least 3 seconds so that you are not transmitting when the ROBOT's FUDtimer decides it is time for it to transmit -- if you are transmitting at the same time, you will miss any packets the shuttle is addressing to you and you won't have a successful QSO.

Note that your DWAIT (how soon do I transmit?) and FRACK (then how long do I wait?) parameters and the need to stop transmitting so you can hear a reply are just like you encounter when working a DXpedition pileup on HF. If the DX station has a pattern of listening for a few seconds (=FUDtimer) before transmitting, you may have better luck being the LAST station they hear, after the din dies down. The differences are that (1) the ROBOT is a computer and is very predictable and (2) the ROBOT can be working several stations at one time.

[ANS thanks W3IWI for compiling the information for this bulletin]

Note: At press time, the leak problem in Columbia's Hydrogen fuel system had not been resolved and a new launch date had not been set. Usually reliable sources indicated that a launch date before June 8, 1990 was not to be expected and the delays could persist for several more weeks.

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 153.06 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date UTC Time Phs Mode NCS U.S. Day

04 Jun 90 0100 104 J/L WB9ANQ Sunday
15 Jun 90 0115 104 J/L N5BF Thursday
26 Jun 90 0115 144 B N5BF Monday

For information on the amateur satellite program and how you can participate, contact AMSAT-NA at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 153.07 FROM AMSAT HQ
SILVER SPRING, MD JUNE 2, 1990
TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The best estimate of the current attitude is:

BLON = 179 and BLAT = -2.1 for 04 Jun 90

Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10's Mode-B Transponder Now Available for Use:

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations, therefore, the transponder is available for general use whenever AO-10 is in view at your location. Please DO NOT use the transponder if the signals are FMing. The current estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

I've got a kenwood tr-2400 handheld, but no manual. I desperately
need to find out from the schematic what kind of transistor Q11 is.
>>>>

My Instruction Manual says Q11 functions as an AVR using a 2SC2603 (E). At
least that's what the block diagram says. The schematic diagram on the next
shows it as a 2CS2668 (Y) ?!! Good luck. If this doesn't help, I have
a Service Manual tucked in a drawer somewhere around here. Maybe a
third opinion might help!

> between my candidate (I5I) and King Hussein (JY1).

A tie, of course, in # of Roman characters only. In standard Morse spacing, I5I wins hands down (21 units to 49). But JY1 probably breaks through the pileups faster.

Another JY1 tidbit: I was browsing through the '90 CB (I know, it's like reading the phone book, but I was sitting in a pileup anyway) and found that Hussein also has an Iranian call - EP1JY. Hmmm.... Also, I5I is not in the 90 CB, but that's probably not surprising.

Actually I am not radioamateur but DX-listener, but I am also interested in VHF. It is surprising that there was an Es opening at the same time in North America and in Europe. Here in Finland I was able to hear on June 1 1700-2000 UTC and June 2 0500-0700 UTC stations from Southern Europe in the BC-FM-band 87,5-108 MHz. Most powerful signals from France and Italy but I also heard stns from Austria, Yugoslavia, Switzerland and W-Germany. MUF was not very high and sometimes there were stns only below 100 MHz, the 100-108 MHz part was open for less than 2 hours.

>or extortion in order to get a rare card. Just a thought.

For those who believe that QSL managers and the like are simply doing it for the money, let me remind you that MOST of us do it simply for the enjoyment and the public service it provides to others. I actually end up putting my own money into it....although I have to think long and hard before I continue to send QSL cards and/or post cards to those hams who feel it's their right to receive QSL cards at another's expense.

I generally send a post card once maybe twice.....after that, their QSL cards go in the trash.

I enjoy sorting QSL cards, but I sure can't say I make any money at it.....

3320. EBS followup and comments on the "old" EBS stuff

Newsgroup: rec.ham-radio
Date: 1990-06-04 14:39:59 UTC
From: MEHARP01@ULKYVM.BITNET
Message-ID: <9006041620.AA24453@ucsd.edu>
Source record: 11226

Thanks to all for the reply on the EBS tones. I have information I need.

As for the old EBS nuclear annoucements...

Play the cart. It's pretty wild. If they are the ones I remember, those are the carts that used to come with the packet of authenticator words for the validation of the War Warning message. They essentialy tell you to "Be strong" and "listen for emergency information." The scripts were published in Government documents years ago. They are typical Cold War Doom and Gloom material. They have old strident sounding 1950's-type announcers reading the messages. They don't make 'em like that anymore.

They stopped shipping the carts after at least one (maybe two) incidents involving stations accidentally broadcasting the war carts when they were supposed to run the EBS test. One of those incidents caused a panic in the town it was played. Station got in trouble, national press, etc., etc. It's bad enough to be an idiot, but to become a Nationally Known Idiot is really bad. Incidents like that are bound to happen, especially with deregulation allowing untrained personnel to operate broadcast stations.

I work as a board op at a PBS affiliate here in Louisville. We still get the sealed envelopes with the authenticator words in them. When the old envelope expired once, we opened it to see what was in it. There's a red card with a list of words and dates. There are also scripts for use when you get the messages. I think that replaced the pre-recorded carts. I know we just have a test cart in our stack. I'll ask around about the war carts. I'm sure a paraphenalia junkie has one around somewhere. I don't think they'll cause stress, except if they get played when they shouldn't be :-). Talk about your Maalox Moments!

Yours for a better tomorrow!

He may have been using one of the new dual-band radios in cross-band repeat mode. Say, an HT on 446.x repeated on the 2m repeater input freq.

> if you know the announcemnt ahead of time! I asked some more authoritative
> people at the station if i could listen to one of the "carts" in an isolated
> room sometime and was told "No.".

Never never never ask first. They will ALWAYS just say "NO" when there is any
doubt whatsoever, and there always is some. Just go ahead and do it and ask
for forgiveness later.

[BTW, this also applies to asking they FCC if "it" is illegal]

> Does anyone out there know what these say? If so could you email me
> what is says, or is that illegal somehow?? WHATEVER YOU DO... Dont reply with
> the actual message to the net!!!!!

Sure, go ahead and post it after you listen to it, unless the cart begins
with a COPYRIGHT NOTICE :-) I doubt if it is copyrighted, so feel free to
make duplicates and all that.

There are in fact networks of repeaters linked together. He may have been operating through such a network. Also, the new dual-band radios have a repeater feature that allows cross-band repeater (fun to try, boring after a while).

>I am trying to open and repair a Yaesu FNB-12 battery pack.
>
While I own two FNB-12s, I haven't had to open them yet. But that day will come. They don't look as hard to do as some of the plastic puzzles I have tackled. The worst one was a battery pack for the STS AV7600 aircraft handheld. It had a L-joint on the top and a neat job was not to be had, but results were usable.
I use various small sharp things like an industrial razor blade, jewelers screwdrivers, hammer and cold chisel, and whatever else it takes to split the seam. I used to have an Ungar soldering iron tip that had an Xacto blade on it, but I haven't had to resort to that yet. This tip was great for making doors that open on model cars, but I haven't seen it since 1966.
Persistance is the word, and I absolutely will not pay $50 to $70 for a new battery pack when all that is wrong in there is usually one bad cell. About 12 volts across its butt for a moment sometimes gives it a new lease on life, but my experience doing this is about 50% success. If you try this, only zap the shorted cell, not the whole pack. Good luck and good cracking.

REF ham radio and radar detectors

A few years back, I had just turned south on I-75 from I-10 when I was nearly blown off the road by a station wagon with the sign of a real estate agency on the door and Georgia license plates. I keyed up the old tube type two-meter rig on 52 and gave a call, of course not expecting an answer in that particular area. The expected result was, of course, to set off his fuzzbuster. The guy immediately slowed down and got on the CB looking for Smokey. Minutes later, he sped up again and several miles later, I repeated the episode. More calling on the CB and re-adjusting the sensitivity on the detector (he turned the dome light on for this). I slowed down and dropped back, then caught up agian to repeat the senario several times. Finally he turned on the dome light again, ripped the detector from his windshield, and threw it into the rear of the wagon and took off. He lost me at about 75 and accelerating. Twenty miles later I passed him whilst he was in the presence of one of Floridas finest receiving his welcome to the state. Justice triumphs again!

Unfortunately most two-meter rigs don't set off the new detectors today, but J.C. Whitney advertises a radar gun that should do the job nicely, no license required!

Hello,

I am looking for a mobile dual-bander (2m/70cm) rig for
the car. My problem is this, nowhere in the ads do they mention
whether they have single or dual antenna ports. I would like one
with seperate ports for the antennae. The units in question are;

Kenwood TM-731A, Icom IC-2400, Alinco DR-570T and DR-590T. I have
already eliminated the Kenwood TM-701 as a single porter. I know
the Yaesu 4700RH has two, but would like more memories. Any help
appreciated.

Originated From: G3RUH 90/05/28 22:51 Msg# 184

FT736 & 9600 Baud Operation
---
by James Miller G3RUH

These notes tell you where to get FM RX audio direct from the discriminator, and where to modulate the FM TX varactor directly. These mods are non-destructive and take no more than a few minutes. The signals bypass the "DATA SOCKET" for high grade FM operations.

The RX mod is suitable for:

* UOSAT-D 9600 baud downlink and terrestrial links
* 1200 baud AFSK/FM Standard Packet - BUT IT'S UNSQUELCHED.

The TX mod is suitable for:

* FO-20/PACSAT uplink (1200 bps Manchester FM)
* UOSAT-D 9600 baud uplink direct FSK and terrestrial links
* 1200 baud AFSK/FM Standard Packet.

---****---

FT736 - FM Direct from Discriminator

Detected FM direct from the receiver discriminator is available from the RX UNIT at the junction of R91 and C83. These components are shown in the top right-hand corner of the schematic.

Proceed thus:
1. Disconnect FT736 from the mains electricity. (Safety).
2. Remove top cover only.
3. RX Unit is the vertical module on the left.
4. Locate R91 which is about 25mm from the top, 50mm from the radio rear. the resistor is "on-end", and near a couple of glass diodes.
5. Scrape any paint off R91's free end and wet with solder.
6. Your RXaudio lead should be a fine screened cable; connect the inner to R91, and the outer braid to a ground point (e.g. can of TO09)
7. Route the cable out though any convenient aperture in the case.
8. The discriminator sensitivity (FM Normal) as about 6 kHz/volt.

Important note on 9600 Baud Use

Most FT736 receivers are fitted with an LFH12-S IF filter for FM. (CF01 at the top front of the RX Unit). This is a 12 kHz bandwidth filter which is

a little narrow for 9600 bps FSK operation. It is recommended you change this to 15 kHz or better still for UOSAT-D use, 20 kHz bandwidth which will allow more tolerance for doppler shift, and give a far better "eye". Suitable filters are: LFH-15S or CFW455E, and LFH-20S or CFW455D. The first of these is a Yaesu spare part, and is often already fitted. Try the standard first and see what happens; these filters have moderate part to part variations.

---****---

FT736 DIRECT VARACTOR FM MODULATION

Refer to the circuit diagram; inject your TXaudio at the junction of R32/C29 on the TX Unit. The signal level at this point should be 800 mV peak-peak, and will give +/- 3 kHz deviation. DO NOT EXCEED THIS LEVEL. Set Mic Gain to min.

Modulating the FM transmitter this way you get an LF response down to 18 Hz (at which point the associated synthesiser PLL begins to track the modulation), and an HF response which is flat to some 10 kHz.

Proceed thus:
1. Disconnect FT736 from the mains electricity. (Safety).
2. Remove top cover only.
3. TX Unit is the module flat on the left (not the one tucked down the side vertically).
4. R32 is just to the left of the rectangular shielded enclosure. The resistor is "on end". Scrape any paint off the free leg.
5. Your TXaudio lead should be a fine screened cable; connect the inner to R32, and the outer braid to the adjacent enclosure.
6. Route the cable out though any convenient aperture in the case.

7a. 1200 BAUD G3RUH PSK MODEM: TXAudio of 800 mV pk-pk can be obtained by adjusting the components C9= 1uf, R3=47k, R5=infinity (i.e. remove). C10 stays at 10nf (0.01uf).

7b. 9600 BAUD FSK MODEM: Adjust TXAudio level with VR1

> Bob W3OTC
> (The June 1 refers to the fact that the 2-meter opening started about 0005 UTC
> June 1.)

That thursday evening around midnight driving home from work I tuned in the
Miami National Weather Service on 162.55 Mhz. Only to find it was being
wiped out by the NWS from Melbourne, FL over 150 miles to the North.
This is usually a good reliable indicator of some kind of opening. This
has happened several times in the past. Thats when I scan the bands look
ing for distant repeaters.

Uh-uh. Were POTUS (the Prez) to take a non-military aircraft, ID would be
"Executive One". Helicopters are usually USMC, and ID "Nighthawk #" until
the Prez boards, then it's "Marine One". Perhaps a USAF helo would be AF-1
for the trip.

Message-ID: <46654@iuvax.cs.indiana.edu>
Source record: 11137

On the night of May 31, I was able to monitor the following from my Gary, IN location:

Various fire calls in south central Pennsylvania (33.6-34.0 MHz)
An 6m FM repeater in Wichita, Kansas (I think it was 29.66 MHz)
KVOU-TV Channel 4 (FOX) in Billings, Montana.

Whenever a band opening such as this comes about, I tune my tv to WBBM Channel 2 in Chicago to determine the "severity" of the band opening. Sometimes the interference in the picture is such that it becomes unintelligible. I have seen stations in Connecticut, Texas, Montana, and Quebec (including a French version of Wheel of Fortune!) during such band openings. Last June (appropiately enough on Field Day :)), there was a E opening and a tropospheric opening at the same time, and lasted almost the entire weekend. I was able to record an FM broadcast in French around 92 Mhz. I could not get the call sign, but I am unaware of any local French language broadcasts.

3338. TNC Simulation

Newsgroup: rec.ham-radio
Date: 1990-06-04 20:26:15 UTC
From: pompano@deaths.dec.com
Message-ID: <12183@shlump.nac.dec.com>
Source record: 11140

Is anyone aware of software that will emulate a TNC?

The reason I'm asking is that I have computer (VAXStation-3100) and a
2400 Modem. I've been considering the purchase of a TNC (MFJ-1278),
however it is about a $280 investment.

I would like to test the whole idea of TNC (i.e. CW, RTTY, Packet, etc.)
without investing a lot of mony up front.

The second part of the above "project" is getting the signal amplified from
the radio output level (mv?) to modem-input level (24-48 volts). I was
planing on building a simple audio amp (with good freq-response).

Any suggestions from the TNC-qeru's?
Jim

3339. MOD FILE: ts790a

Newsgroup: rec.ham-radio
Date: 1990-06-04 20:28:45 UTC
From: mark@HAMSTER.BUSINESS.UWO.CA

Source record: 11134

==========

I received this in the mail so I am posting it to the net.

x---- cut -----x

CROSS BAND REPEATER MOD
To operate the TS790A in the repeater cross band mode,diode D32 on the control board must be opened.In addition,two resistors must be soldered to a 13 pin din plug which will be connected to the ACC. 2 jack on the back panel of the transceiver.

TO LOCATE AND OPEN D32
1 Disconnect the power supply and antenna from the radio.

2 Remove the 14 screws that secure the top and bottom covers.

3 Carefully remove the top and bottom covers.

4 Locate the control board. this is a vertically mounted board that is positioned approximately 1 inch behind the front panel.

5 Locate diode d32 towards the top right side of the board.

6 Using a small pair of wire cutters,cut the lead of the diode. do not pull on the lead or the diode as this may tear the foil on the other side of the board.

7 assemble the radio by reversing steps 1-3.

13 PIN DIN PLUG CONFIGURATION.

1 Using a small flat blade screwdriver,lift up on the tab of the nylon cover.

2 Once the tab clears the slot of the metal holder,pull the cover off the plug.

3 Carefully separate the two metal holders and remove the pin assembly.

4 First tin pins 1,8 and 11 of the assembly so the resistors can easily be soldered in place.

5 SOLDER A 100K ohm,1/4 watt resistor between pins 1 and 11 of the assembly (the resistor leads should be cut and shaped before soldering).

6 Solder a 1.5K ohm,1/4 watt resistor between pin 8 and the lead of the 100K ohm resistor that is attached to pin 11.(the resistor leads should be cut and shaped before soldering)

7 Wrap a small piece of electrical tape around the resistors.This will insulate them from the metal holder after the plug is assembled.

8 Mount the pin assembly in the two metal holders.

9 Slide the cover over the plug until the tab engages in the slot. The "U" shaped strain relief will not be used.

10 Plug the 13 pin din plug in the ACC2 jack on the back panel of the radio.

OPERATING PROCEDURES

The repeater cross band operation allows the TS790A to receive on one band and re-transmit the signal on the other band. Incoming signals will automatically be switched to the sub band.The TS790A will then re-transmit the signals from the main band. Each band may contain offset and sub-audible tone information (an optional TSU-5 must be installed in EACH BAND for decode).

1 Press the MAIN function swich to select the MAIN band.

2 Select the first operating frequency and mode (fm only).Select the offset as required.

3 If the CH.Q is on,press the CH.Q switch to turn the function off.

4 Select the sub-audible tone as required .

5 Transfer the contents of the MAIN band to the SUB band.

6 Select the second operating frequency anf mode (FM ONLY) and turn the CH.Q off.

7 Select the offset and sub-audible tone as required.

8 Adjust the MAIN and SUB band squelch controls to the threshold point.The TS790A will transmit in the repeater crossband mode if the squelch controls are set too low or a signal is received.

9 Adjust the power control to allow normal output power from the MAIN band.

10 Adjust the sub band volume control to a normal listening level to monitor incoming signals.

11 To place the radio in the repeater cross-band mode,press the F. switch and then press the M.IN switch. An asterisk will light in the MAIN band display for confirmation.

12 To cancel the operation,repeat step 11 and disconnect the DIN plug.

13. If the DIN plug is left in place after use,bleedover from the SUB band audio if present will be mixed with any transmitted audio. This will make your audio during a conversation hard to understand.

TSU-5 TONE UNIT

When the TSU-5 tone units are not installed,only the tone (encode)
function can be used.
If CTCSS is to be used it must be installed in both bands to function
with the cross-band repeater mode.

TX AUDIO ADJUSTMENT

The audio gain can be adjusted by variable resistor VR36 on the IF unit.
If the range of VR36 does not suffice for normal transmit audio,the
values of the resistors on the 13 pin din plug can be changed.
as an example,if the audio is too low,reduce the value of the 100K ohm
resistor and increase the value of the 1.5K ohm resistor.

TO ACCESS VR36

1 Remove the bottom cover of the radio to expose the IF unit.

2 locate VR36

3 Use a plastic alignment tool to adjust VR36 for normal TX audio.

4 After the audio is adjusted,install the bottom cover.

73 AND HAPPY MODING

==========

I received this in the mail so I am posting it to the net.

x----- cut ------x

EXTENDED FREQUENCY RX AND TX OF THE ALR22T & ALR22HT
ALINCO 2 METER RADIOS.

BEWARE OF ANY STATIC WHEN WORKING WITH THIS RADIO !!!

1 Remove the top and bottom covers of the radio.

2 Remove the 4 screws that hold the front panel assembly to the main
chassis.

3 Pull front panel away from the main chassis very gently.

4 Locate the Volume\Squelch pot on the left side of the radio.

5 Locate the VFO control on the left side of the radio.

6 Between the two above units is an IC that runs vertically between
the two units. (ONLY THE 12 PINS OF THE IC ARE SEEN FROM THE BACK)

7 After locating the IC locate 3 sets of unsoldered jumper pads between
the IC pins.

8 Make a solder bridge between the top 2 pads,then the middle 2 pads,then
between the bottom 2 ONLY of the bottom set of 3 pads.

REAR VIEW OF FRONT PANEL

```
/ ------\ 12 PIN O * O /---------\
/ VOLUME \ IC -> |<-SOLDER BRIDGE / \
/ CONTROL \ O * O / \
/ \ / VFO \
\ / O * O \ CONTROL /
\ / |<-SOLDER BRIDGE \ /
\-----/ O * O \--------/
```

```
O * O
* DO NOT SOLDER THE TOP PAD
O |< O OF THESE 3 PADS
* \SOLDER BRIDGE HERE
```

9 RE-ASSEMBLE RADIO .

10 RESET MICROPROCESSOR.

11 This mod will extend the RX range as well as the TX range of the above unit.The display will have a range from 29mhz to 299 mhz but this is just an erroneos display as the PLL on a typical radio will rx between 130 mhz and 180mhz with a TX range that may be a little beyond these these frequencies.

GOOD LUCK AND HAPPY MODING

I used to be the supervisor of the NOAA Weather Radio unit at the NWS office
in the OKC/Norman area. That message (from memory!) says, "The United States
Government has declared that a Nuclear Attack is imminent(sp?). You are
directed to tune to your local Emergency Broadcast Station for safety
information." Or some such nonsense.

Procedure was: tone alert it. Do it live while recording and leave it as
the only one running on the console.

Off the record, most of my employees said that if it were the real thing, they
would append .."and stick your head between your legs and kiss your a..
goodbye." I would've problably done it too.

3344. Review: AOR AR-1000 Handheld Scanner

Newsgroup: rec.ham-radio
Date: 1990-06-05 01:02:02 UTC
From: garvin@ccvr1.ncsu.edu
Message-ID: <1990Jun5.010202.6800@ncsuvx.ncsu.edu>
Source record: 11144
Cross-posted to: rec.ham-radio,rec.radio.shortwave

As I mentioned in an article a few weeks ago I ordered the new AOR AR-1000 handheld scanner from Grove Enterprises. I had been looking at the ICOM R-1 intending it as a replacement for my old Bearcat 100XLT, but the R1 is either a short or a long way off depending on the phase of the moon. Several people have posted or mailed asking for a report on how the scanner performs, so here is my review.

* * * * *
DISCLAIMER: These are my opinions. I am not an engineer, just a scanning fan. I do not work for any of the companies mentioned below, nor will I gain any compensation for this report.
* * * * *

AOR AR-1000 Handheld Wide Range Communications Monitor
---

o Frequency range: 8-600, 805-1300 Mhz (minus TV)
o Scan/search/manual tuning
o 1000 non-volatile memories, 10 banks of 100 channels/bank
o Scan rate: 20 memories/sec
o Tuning steps: 5 to 995 kHz, divisible by 5 or 12.5
o Receiving modes: AM, NFM, WFM
o Sensitivity: 0.35 uV NFM, 1 uV AM/WFM
o Search: 40 increments/sec
o Features: delay/hold, squelch, priority on any channel, 10 db selectable attenuator, 4 AA nicads (13.6 VDC), 12 oz weight, 2.5"W x 6.84"H x 1.75"D, AC wall charger/adapter, carrying case, belt clip, cigarette lighter adapter
o Price: $499, Grove has for $459

First (open box) impressions:

The case looks much better than the Uniden cases. There is a removable metal belt clip poking through from the back of the scanner and a clear plastic shield over the keys. The whip antenna looks like one of the Larsens. The weight and feel are JUST right, unlike the heavy and tiring Bearcat. The manual tuning knob on the top seems a bit too long for the unit; it rotates left/right to decrement/increment the frequency by the desired step. Squelch and volume are a single knob on the top; the squelch is the outside jacket of the volume. The local/DX switch is also on top.
The keypad looks nice, and so does the display. The light is a little wimpy, though. Four(4) AA nicads supply power to the unit, no more hunting for odd battery packs.

Operation:

Here we go. It took about 1 hour to master the Bearcat; it took 3 _DAYS_
to learn the AOR. Their manual didn't help matters. It looks like something
an engineer knocked out (no offense intended). It is a piece of junk. Things
are cut-and-pasted into a mess, there are two(2) sections on scan limiting
that are identical, and there are general errors. But the manual is vital in
order to learn the unit. It's like flying the shuttle. Take entering bank
numbers to scan for example:

o Bearcat: hit <SCAN>, then the bank number. For multiple banks press
their numbers. The numbers are toggles (on/off).
o AOR: hit <SCAN>, <BANK>, <PROG>, <LIMIT>, lower bank limit, <LIMIT>,
upper bank limit, <ENTER>.

Searching is MUCH worse.
Gripe: if I wanted to scan banks 1 and 5, I can't. I'd have to scan
banks 1 THROUGH 5. Trying to lock and unlock banks is also a pain. I
accidentally locked out all the banks, and it took 2 hours of unlocking
every channel to get the scanner back.

Scanning:

Performance rolls off below 30 Mhz and above 1200 Mhz. As a shortwave
receiver I don't put much stock in the AOR. It didn't do well. I was
able to copy a few stations but they faded in and out. OK, so I didn't
hook it up to an active antenna or a longwire. I only used the whip and a
shortwire. But I barely picked up anything under 30 Mhz even under good
conditions.
UHF, particularly ~460 Mhz (local police): does OK. Some birdies and
false detections around here (400 to 600 Mhz), but all-in-all just as good
as the Bearcat. Couldn't test the 200 Mhz region since we don't have any
close military installations, and I couldn't get any drug/FBI/Secret
Service/gov't stuff.
Aircraft bands (108-136 Mhz): here I had a problem. Even sitting at the
end of the runway I could not pick up traffic as well as the Bearcat. The
transmissions were garbled and faint. The AOR apparently has problems with
this region.
Cellular? Of course I didn't listen, so I can't say (ahem). I imagine,
though, that it would do as well as can be expected (cough). The upper
reaches (900+ Mhz) went untested as I never could hear anything.

Conclusion:

It went back to Grove 12 days after receipt. I got tired of fighting it
and constantly being reminded of its shortcomings. And I really wanted
shortwave, where it showed its worst performance. Perhaps a real shortwave
antenna would have helped. As far as the other bands were concerned I used
the unit with the supplied whip and with a Radio Shack discone antenna
(25-1300 Mhz). Reception improved, but so did the false reports (it locked
more noise as a station). Rejection was not too good.
Also, it seemed that every time I turned the unit on I had to re-adjust

the squelch, even if I had not moved it. Another thing: it picks up harmonics VERY well. One of our local stations on 89.7 Mhz FM came through on our local NWS weather channel (162.55 Mhz), down to about 50 Mhz, and all the way up to 200 Mhz in good conditions. Admittedly this is their problem, but the AOR didn't make it its problem.
In short, I was disappointed. Looking back I have to realize that AOR was trying to cram quite a lot into such a small package and that I should not have set my hopes too high (an ICOM R-9000 in a handheld). But I still feel that a separate shortwave and scanner are the way to go with the current market situation. I continue to await the ICOM R1, and will make a road trip to see and test it. But I'm going to be happy with my new Bearcat 200XLT until then.
This may, however, be the scanner for you. I will not go onto the record as opposed to the AOR; it simply wasn't what I wanted. You should try one out before you buy it or any other.

If anyone has any specific questions or discussion I'll be happy to answer them as best I can without the unit. Just drop me some mail.

SB RTTYDX @ RTTYDX $RTDX0106
RTTY DX Notes, 1of3, 6/1/90

RTTY DX Notes for Weekending 1st June 1990.
Part 1 of 3.
BID: $RTDX0106

If this week's DX notes appear a little sparse, I must apologize, as I
can only report what information I receive. This week there has been
very little activity, or maybe everyone was chasing the Yemen station.
Conditions of course were not the best for most of the week, and that
did not help either. So all that I can say is that we are not up to
our usual standard this week. We will try harder next week in the
ANARTS contest.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1BLV, OD5NG, TG9VT,
VK2EG, VU2DPG, and W0LHS. Thanks chaps for the news and DX in your
areas. It all helps a lot.

5N8ALE will QSL via DJ2VZ.

Notes of Interest:

Minami Torishima. KA2XX should be active from June 1st for a one week operation. QSL to KD7P.

Solomon Islands H44. ZL1AMO, Ron, will be QRV from June 6th until June 24th, signing H44RW. It is believed that he will be on RTTY as usual. QSL to his home call.

Continued in part 3.
/EX
SB RTTYDX @ RTTYDX $RTDX0306

RTTY DX Notes, 3of3, 6/1/90

RTTY DX Notes for Weekending 1st June 1990.
Part 3 of 3.
BID: $RTDX0306

Lord Howe Island. VK9LI will be active from June 7th until approximately June 13th, especially during the ANARTS RTTY Contest from June 9th to 11th. He will operate RTTY only, maybe some AMTOR. Due to the sudden rise in costs, small donations would be appreciated.

Chafartnas Island, AN9CI. EA9JV will be qrv from June 14th for one week. This is good for IOTA and prefix hunters awards.

Yemen, 7O1AA. Beware. There are pirates using this call. Make sure that you work the right one. They are only on SSB at the moment and for the next nine days.

Marion Island. ZS8MI has a new operator. He may turn up on RTTY, who knows?

VQ9ZZ. He is active again. The last time we saw this call he was onboard ship in the harbor, and using commercial gear. Hence he cannot use the four letter selcal, so that is why he is on FEC Only. Maybe it is the same operator, and not being on land it does not count as a legitimate VQ9 operation.

Everyone is smiling. They have received their JT0DX cards. It pays to wait and wait at times.

See you in the ANARTS contest on 9th June 0000Z until 11th June 0000Z.

For VK9LI QSL card and donations send via VK2SG.

Sorry for the brief notes, chaps. Hope for better things next week.

GL DE DX1 (VK2SG) VIA TG9VT.

Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

> ...Incidents like that are bound to happen, especially with deregulation
>allowing untrained personnel to operate broadcast stations.

What does deregulation have to do with it? The old FCC 3rd class license
didn't particularly require brains, you know. Besides, when you are the sole
operator of a station, for hours at a time, you're bound to make some mistakes.
Blame the station manager (or Chief Engineer) for putting the tapes where they
could be confused with the test tapes. This stuff was happening in the late
50's and 60's, when we were still regulated.

>The mag mount gets knocked over and scratches the roof.
>Does anyone have any success stories or recommendations?
>
>Thanks in advance.
>73, jim ky2d
>---------

I don't have a Caravan, but I do have a Jeep Cherokee and a similar
problem. I ended up using a Larson 1/4 wave with the L-shaped
mounting bracket that is designed to attache between the trunk lid
and fender of a sedan using sheet
metal screws. I mounted this antenna at the top of the hatchback.
The antenna doesn't quite miss the open garage door (by about 1.5 inches)
but its good enough to enter and exit without problems. It ends up
being a pretty good low profile antenna.

This can't be Sporadic E because the station you heard is only 150
miles away but tropo-opening.

> already eliminated the Kenwood TM-701 as a single porter. I know
> the Yaesu 4700RH has two, but would like more memories. Any help
> appreciated.

The Icom IC-2400 is a dual antenna port radio. The IC-3210 uses one port
but it is on sale right now while dealers try to unload their stock. The
difference is greater than the cost of an external VHF-UHF duplexor.

The IC-2400 has 20 memories. I believe it might even be possible to save
20 VHF and 20 UHF frequencies with offsets, but I am not sure.

Icom also has a matching UHF/UHF dual band, the IC-2500, with 70cm and 23cm.

3353. Re: QSL'ing for money

Newsgroup: rec.ham-radio
Date: 1990-06-05 12:58:13 UTC
From: davet@tsdiag.ccur.com
Message-ID: <998@tsdiag.ccur.com>
Source record: 11171

In article <1990Jun2.134941.28957@cbnewsk.att.com> wheatley@cbnewsk.att.com (steven.m.wheatley) writes:
-In article <991@tsdiag.ccur.com>, davet@tsdiag.ccur.com (Dave Tiller N2KAU) writes:
->
-> Could earning money in excess of the cost of QSL cards, postage, etc
-> be considered doing buisness on the air? Just like VE's aren't allowed
-> to charge more than the cost of materials for exams, couldn't the same
-
-With few exceptions...the manager does not
-request more than the cost of returning the card. In fact, consider
-that, if one sends a manager a SASE with his/her card, then the
-manager AUTOMATICALLY is out some money due to QSL card printing.
-Admittedly that isn't much, but when you get something in excess of
-500 cards per month (as I do), it adds up. Add to that the cost of
-replying to bureau replies (the envelopes at the bureau, postage and
-cost to send back thru the buro, etc...) NOT TO MENTION THE TIME!,
-QSL managing isn't a profitable situation. (Note...some managers
-DO NOT reply to bureau cards, but there is increased pressure from
-various ham organizations to do so).
-
-The folks that send a greenstamp for return postage without being
-required to do so are essentially 'donating' to the QSL manager's
-war chest. I think your point is interesting, but unless required,
-the money sent above and beyond the cost of returning a QSL is
-usually an attempt on that ham's part to keep the Manager from
-LOSING any more money, rather than 'padding his/her wallet'. As
-mentioned earlier, of all the DX stations I QSL for, the balance
-runs positive for only one, that because he is extremely rare, and
-does some 1000+ contacts a month, often on rare modes (VHF,
-Satellite, RTTY, etc). The balance is kept near '0' by sending
-equipment to further these operations. I am more comfortable doing
-this than 'pocketing' the change, but this decision is my own. I
-suspect, having been in this arena for some time, that managers are
-not a profitable function. If you doubt it, try being one sometime!
-
-73, steve ku9c

In my original article I didn't intend to imply that all or even most QSL managers are trying to line their pockets!! I understand that the vast majority are volunteering their time and efforts (and sometimes money) to the cause, and I appreciate that. The problem I have is with folks who say, "You want my QSL? Send SASE and $1." If they expect me to pay return postage that's OK, but I fear too many people are using QSL cards to finance trips and the purchase of new equipment. This income is earned over the air,

and IMHO, could be construed as business/using Amateur radio for profit. QSL'ing is for the joy of collecting cards from exotic places, not for trying to finance your next DXpedition or your next rig out of it. If money is earned(?) above and beyond the cost of QSL'ing, I think that (ideally) it should go back to the Amateur community at large, either donated to RACES or other worthwhile public service, Amateur related groups. Another place that needs money is for educating the young about AR. What about setting up a program (like uniden) to donate radios/time for schools out of this money? Just a thought. I'm sorry if I offended any QSL managers - you don't set your Dx station's policy for QSLing, they do. I know you put in long hours and lots of labor, and I certainly do appreciate it!

3355. Yaesu FT-101EE question

Newsgroup: rec.ham-radio
Date: 1990-06-05 15:39:02 UTC
From: lrj@ishtar.cs.cornell.edu
Message-ID: <41755@cornell.UUCP>
Source record: 11161

I've a question regarding a Yaesu FT-101EE HF rig.
Essentially, what should the microphone impedance be?

When I purchased the rig a few days ago, I got a Yaesu
four-pin hand-mike with it. I'm not sure if this is working
properly. Here we go:

Here is supposed to happen: you key up the mic and start
talking into it. The ALC needle starts at full scale with no
modulation, and you advance the mic gain until voice peaks are
causing the needle to dip about halfway through the green
region on the meter. This translates to the needle dipping to
roughly 2/3 of full-scale.

What happens: at full mic gain, the ALC hardly even moves.
Yelling/whistling into the mic will obtain some deflection.
However, I had a QSO with two friends last night on 10m and
I had to drop the mic gain to "2" to be intelligible. At this
level, neither the Power Out nor the ALC indicators moved.
The Drake matching network also didn't indicate any output
power. The two friends were about 1 mile and 15 miles away
and were getting S9 signals.

Before I purchased the rig, the fellow I bought it from
demonstrated it using a desk mike (which he wanted to keep).
I've not yet had a chance to get in touch with him to find out
what he knows about the mic he gave me.

As a side note; the power output needle (on the Drake and
the Yaesu) does move to appropriate values when operating
10m CW.

So, anyone know what's happening? I put an Ohm meter
across the mic terminals (with the mic disconnected) and
saw ~500 ohm impedance.

And if you install the TAPR XR2211-DCD modification, for $11, you'll be able to run with your radio's squelch open, which means the other guy can cut his TXD in half or better, which means that EVERYONE on the channel will enjoy increased throughput and fewer collisions.

Takes about 15 minutes to install, assuming you know how to solder.

3357. NJ Scanner Law Coming up for Vote

Newsgroup: rec.ham-radio
Date: 1990-06-05 16:03:08 UTC
From: judice@sulaco.enet.dec.com
Message-ID: <9006051603.AA18569@decpa.pa.dec.com>
Source record: 11162

According to Senator John Lynch's office, S-305 is coming up for a vote shortly in the NJ Senate. This bill repeals Public Law 1977 and makes it a crime to MISUSE information intercepted by radio, while LEGALIZING the installation/use of scanners and wide-band tranceivers in vehicles.

New Jersey residents should call their State Senator TODAY to express support, for this legislation.

If you don't know who your state senator is, call:

NJ State House - 609-292-2121 and ask for the public affairs office.

Call today!

3358. ICOM IC24/AT realy does more than advertized

Newsgroup: rec.ham-radio
Date: 1990-06-05 16:14:38 UTC
From: rbono@necis.UUCP
Message-ID: <1335@necis.UUCP>
Source record: 11169

I have seen several postings concerning the ICOM IC-24AT. This is the latest/hotest hand held tranceiver from ICOM, the local radio shops (there are three of them in the area) can't keep these things in stock, one store sold 10 of them in less than a week! Most postings were concerning how to "modify" the radio to expand its receive range, and how to get it to do 'cross-band-SIMPLEX-repeat' functions.....

Well, I purchased one of these neat little 'babies' for my wife!!! She recently passed her Extra exams (she is now WG1G), and held me to my promise of buying her any radio that she wanted if she passed the Extra. (Boy, am I glad she doen't *like* CW and has not YET found out how much fun the HF bands are... I might have had to buy her an IC-781..... about $6,000.00!!!).

So I thought that I would let the net know what I have found out about this radio first hand.... (instead of a 'I heard that it can do this' message).

The radio is very well designed (in my opinion). No, there is not just one Integrated Circuit inside the thing!!! It appears to be very ruggedly constructed. Out of the BOX it does everything that ICOM says.

One thing that is confusing in the advertisements.... they state that each memory channel (there are 40 of them) is 'double spaced' and can hold a separate frequency for each band. This implies to me that I should be able to use about 80 channels (since the radio has two bands, 2 meters, and 70 cm). What this really means is that each memory 'channel' can hold all information concerning offset, split, etc... and including, FOR CHANNELS PROGRAMMED AS FULL DUPLEX or 'split' mode, both frequencies used for the 'split' operation (this 'split' is for full duplex-cross-band, not a transmitter offset for repeater use). Although you can (with some button pushing) use each frequency stored as 'split' in a simplex mode, you have to not mind pushing a few buttons.

By the way, only one 'band' can be active at a time... you can't listen to both bands at the same time. My wife thinks that this is a blessing... If you were able to listen to both bands at the same time, there could be confusion on which band someone called you from.

Here is some of the "interesting" information. The so-called "modification" to enable the wide range RECEIVE ONLY frequency converage did NOT require any hardware changes to the unit.... (a FEW early units did require a diode to be removed)... simply hold down a few buttons when turning on the unit and keep them held until the unit is done with it's self test (Light-B-#).

If you also do one of the following (each one override the other) you can 'modify' the method used to enter the frequency: (Hold down the indicated keys WHILE turning on the power switch)

Light-1 must enter the 1 MHz through 5 KHz (4 digit entry)
Light-2 must enter the 10 MHz throuth 5 KHz (5 digit entry (default))
Light-3 must enter the 100 MHz throuth 5 KHz (6 digit entry)

When the Light-3 mode is set, I can get the radio's display to go from 0.000 to 1.3GHz (or so, enter 999.995 MHz and then use the 'vfo' knob to 'scroll' up into the 1 GHz 'display' range).... sorry to report that the dislpay shows that the PLL is 'unlocked' over *most* of this range.

The radio will RECEIVE (only) on many interesting frequencies... alas, some have lower sensitivity (this is acutally a plus, the radio's front end is not as wide open as a 'barn door').

I have heard significant signals on the aircraft band (Yes it does demodulate the AM signals here), the Marine, and VHF commercial range (including NOAA weather), and a lot of interesting signals around the 800+ frequency range. Sorry to say that the sensitivity is a bit lacking around the 220MHz range. I live less than 1/2 mile from a 220MHz repeater and I couldn't hear the repeater on the IC24AT with it's flexible antenna... yet I could hear a 1 watt handheld when used on my property (line of sight??).

The radio offers a significant number of scanning modes, searching, etc, that can be programmed as each user desired... see the manual, there are too many 'programmable' modes to mention here.

The ONE hardware mod that I performed on my radio (oops, her radio) was the removal of a diode from the CPU board... the diode is VERY easy to locate (D14), it is NOT a 'surface mount' device, and it's very obvious, it can be 'clipped' out if the user is not handy with a soldering iron (if you are not handy with tools, DON'T dive into your radio... get someone to help you who is technically able).

After D14 is removed, the radio can be placed into 'cross-band-simlex-repeat' mode by pressing a few buttons (Function-5D). This works ONLY when the radio is set to 'split' mode (Function-C). The way it works is as follows:

Program two SIMPLEX frequencies into the VHF and UHF vfo's and set the radio for cross-band-full-duplex (press Function-C until the 'split' indicator is displayed) (or use a memory channel programmed for 'split' operation), then put the radio into 'reapeat' mode (press Function-5D). The radio will start to quickly 'scan' back and forth between the two frequencies. When a signal opens the squelch on one band, the transmitter turns ON on the other band, viola! instant SIMPLEX repeater! When the first signal drops its carrier, the radio continues to scan the two frequencies. To turn off the 'repeater' function, press Function-D.

This works great, and will allow a 146MHz to 440MHz 2 way link. But you must remember that it is a SIMPLEX link. As long as there is a carrier present, the transmitter is ON for the other band. DON'T TRY TO LINK TO A 'STANDARD' REPEATER in this mode. One drawback (or blessing) is that the transmit offset is cancelled when in split mode. This forces a simplex circuit on each band.

We have used these types of things to allow hams without 146MHz hand held
radios to work with a public service event that is using a 146MHz simplex
frequency as the operating frequency. One of these babies set to 'link' in
a 440MHz to the operating 146MHz frequency allows hams with 440 hand helds
to operate. We just have to be careful about several things....,
there is no (auto) IDer... so we need to remember to ID the link in voice.
Also, don't remote mount one of these babies... if something goes wrong,
the only control is to walk up to the unit and turn it off, or press some
buttons.... BE CAREFULL out there, and refer to part 97 of the FCC rules
governing links, remote bases, repeaters, and other such things!!!

I hope *someone* finds this information useful. I am sorry that I don't
have the radio in front of me so that I can describe a lot of other things
that it does... But my wife will not let me near the thing!!! She says that
everytime I pick it up, I reprogram it, and don't return it to her 'favorite'
settings.... Gee, maybe there is a way to program its mode for a particular
operator, with password security, and such!!!! I'll just have to sell my
IC-u2AT, IC-3AT so that I can afford one of these IC-24ATs for myself!!!

I played one of these tapes at a non-commercial station in the 1960s.
The reference to nuke war must have been a joke. These are generic
tapes for any emergency (tornado, hurricane, civil unrest) and simply
direct listeners to tune to the EBS station serving their community.

Any implication that these are only for nuclear conflict are the result
of someone's fantasy and cold war hysteria.

3360. Re: Dual-banders

Newsgroup: rec.ham-radio
Date: 1990-06-05 17:23:39 UTC
From: jre@sactoh0.UUCP
Message-ID: <3211@sactoh0.UUCP>
Source record: 11167

The Kenwood 731 has two antenna ports. I highly recommend
this radio. It is the best dual-bander I've ever used.

It has 14 memories per band, plus a seperate VFO per band,
plus a call channel. I've got more memories than I know
what to do with. And it is easily modified to receive
out of band (so it can be used as a scanner to listen
to the fire dept, etc).

It is also easily modified (just clip a diode) to operate
as a "cross-band repeater", which allows you to use the
radio as a "mobile extender" from your low-powered HT.

A COMPARISON OF OPTICAL AND RADIO ASTRONOMY

by David J. Babulski

Electromagnetic radiation from space arrives at all wavelengths,
from very short wavelength gamma rays to long wavelength radio waves.
This wide spectrum of electromagnetic radiation is constantly
bombarding the atmosphere of Earth. We humans live on the surface
of the planet at the bottom of a giant ocean of atmosphere. This
several-hundred-kilometer thick layer of mixed gases filters out
most of the impinging electromagnetic radiation, leaving only two
substantial "windows" into the Cosmos.

The narrower of these two primary windows is called the Optical
Window and includes three portions of the spectrum:

The near-ultraviolet, that is, wavelengths longer than about three thousand Angstroms (an Angstrom is equal to one-hundred-millionth of a centimeter) or 0.3 micrometers (a micrometer is equal to ten to the negative six power or 0.000010 meter).

The "visible" section, which includes the "colors" that we can see: Blue (about five thousand Angstroms or 0.5 micrometers) to red (about seven thousand Angstroms or 0.7 micrometers).

Portions of the infrared (with wavelengths up to forty Angstroms or 0.04 micrometers).

The other, larger portal into the Cosmos is called the Radio Window. It includes wavelengths from about one millimeter to about twenty meters. The long wavelength cutoff depends somewhat on conditions in Earth's ionosphere.

Before we continue with a comparison of optical and radio astronomy, it may be useful to discuss the major component that these two disciplines have in common: Electromagnetic radiation.

Electromagnetic Radiation -

To fully understand electromagnetic radiation, we must first travel back in time. Our first stop is to early Greek history circa 585 B.C. It was around this period that Thales of Miletus (c.624-c.547 B.C.) noted that bits of amber rubbed with fur mysteriously attracted feathers and other lightweight objects. Also during this era, the curious property of the mineral lodestone to attract bits of iron was observed.

These observations were long regarded as curiosities and were generally ignored until the early years of the Nineteenth Century, when such curiosities were described in terms of electricity and magnetism.

In the early 1800s, Charles A. de Coulomb (1736-1806) in France measured the electrostatic force acting against a spring. About the same time, Count Alessandro Volta (1745-1827) in Italy invented a battery which was the first practical source of continuous electrical current.

Stepping ahead twenty years to 1820, Oersted of Denmark demonstrated that a magnetic field existed around a wire which was carrying electrical current. In this same time period, a French physicist named Andre Marie Ampere (1775-1836) described the attraction and repulsion between two wires carrying electrical current in the same or opposite directions.

It was shortly after these discoveries in the early 1820s that Georg S. Ohm (1787-1854) of Germany developed a thermocouple of iron and copper bars. When the junction of these bars was placed in a fire, Ohm noted that electrical current was generated. By using various lengths of copper wire, he formulated the famous laws that

bear his name. These laws relate the flow of electric charges (current) in a conductor to the electrical potential (voltage) and the reaction of the circuit (resistance).

By the year 1830, it was fairly well known in scientific circles that when current flowed through a conductor, a magnetic field was formed around the wire. The reverse case was not an easy experiment to verify. Several luckless investigators tried to wrap a wire around a magnet to generate an electrical current in the wire.

In 1831 an English physicist named Michael Faraday (1791-1867) almost accidentally discovered that it was a moving magnet and not a stationary one that produced an electrical current in an adjacent conductor. Faraday proposed the daring concept that all space was filled with various force fields: Magnetic, electric, radiant, thermal, and gravitational. Based on his field theory, Faraday daringly postulated the principles of electromagnetic induction and the field theory, which proved to be the missing links between electricity and magnetism.

In the United States one decade later, a scientist by the name of Joseph Henry (1797-1878) demonstrated the concept that electromagnetic energy could be propagated through space and detected at a distance by noting the inductive action of a spark circuit picked up by a parallel circuit some nine meters (thirty feet) away.

By the 1850s, the various bits and pieces about electricity and magnetism were well known and documented: Coulomb's Law covering the relationship between the electric charge and the mechanical force it produced; Ampere's Law relating electrical current and magnetism; Gauss' Law covering the relationship between electric charge and the electric field; and Faraday's Law, which explained the relationship between the magnetic field and the induced voltage.

It was not until the late 1860s that the brilliant Scottish theoretician James Clerk Maxwell (1831-1879) unified these various laws into a complete electromagnetic theory which is today ranked in importance with Sir Isaac Newton's (1642-1727) concept of gravitation and Albert Einstein's (1879-1955) theory of relativity.

James Clerk Maxwell -

This Scottish physicist and mathematician is generally considered to be the greatest theoretical physicist of the Nineteenth Century. Maxwell became a student of the senior scientist Faraday, studying all of Faraday's work in order to become thoroughly familiar with his concepts and line of reasoning. Maxwell was intrigued by the apparent lack of a unified theory of electric and magnetic behavior.

From Faraday's work and his own experiments, Maxwell derived a breathtaking concept and a set of elegant equations that encompassed the various laws of electricity and magnetism and which form today's basis of electromagnetic theory.

The unique picture presented by Maxwell of the interchange between electric and magnetic fields in free space was supported by a set of equations descriptive of any form of wave motion propagating itself freely from place to place.

Equation 1: div E = 0

Equation 2: div H = 0

Equation 3: curl E = -1/c dH/dt

Equation 4: curl H = 1/c dE/dt

In these equations, the term "E" represents the electric field, commonly expressed in Volts/meter, and the term "H" represents magnetic induction and is expressed in "Teslas" (1 Tesla = 1 Weber/meter squared).

The term "Div", referring to the mathematical operation "Divergence" is a measure of the total flow of E or H into or out of a point in space. Similarly, the term "Curl" is a mathematical operation measuring "vorticity", the amount of whirlpool-like structure about a point in space. A detailed analysis of Maxwell's Equations is beyond the scope of this article. However, a brief discussion of what each of the four equations describes follows:

Equation 1 states that in the absence of electric charges, electric lines of force can neither be created nor destroyed.

Equation 2 states that in the absence of electric charges, magnetic lines of force can neither be created nor destroyed. In addition, Equation 2 states that magnetic charges do not exist.

Equation 3 is a generalized statement of Faraday's Law that a changing magnetic field produces an electric field and that the ratio of the electrostatic units to the electromagnetic units is a constant related to the speed of light (300,000 kilometers per second/186,000 miles per second).

Equation 4 states that a changing electric field produces a magnetic field.

These four equations also showed that a "disturbance" in the electromagnetic field did not die out, but rather could propagate outwards from its origin in the form of waves traveling at the speed of light.

Maxwell termed such a disturbance in the electric and magnetic fields an "electromagnetic wave" and pictured it as an electric wave at right angles to a magnetic field with both waves propagating in phase. Maxwell was able to show that these waves have all the known properties of light. Light was therefore discovered to be an electromagnetic phenomenon.

As the 1800s neared an end, Heinrich Hertz (1857-1894) of Germany succeeded in generating electromagnetic waves of long wavelength, which we now call radio waves. Further, Hertz found that the velocity of these long waves was exactly equal to the velocity of light. Thanks to Maxwell and Hertz, we now know that light and radio waves are both forms of electromagnetic radiation, with light being composed of very short wavelength and radio waves composed of very long wavelength. Equation 5 shows the mathematical relationship between wavelength and frequency:

v = c/lambda

In Equation 5, the symbol "c" equals the speed of light in meters per second; the Greek letter lambda is the wavelength in meters; and the symbol "v" equals the frequency in Hertz (or cycles per second). A more convenient arrangement is to convert Hertz to megahertz (abbreviated "MHz"). The revised mathematical expression is shown in Equation 6:

v (in MHz) = 300/lambda (in meters)

To see how this relationship works, let us convert the mid-point wavelength of the Optical and Radio windows to their corresponding frequencies.

The mid-point wavelength of the Optical window is about two micrometers (or 0.000002 meter). Using the relationship in Equation 6, the corresponding frequency is 150 million MHz - a very high frequency indeed!

At the other extreme, the mid-point wavelength of the Radio window is about 0.5 meters. Again, using the relationship in Equation 6, the corresponding frequency is about six thousand MHz, or six gigahertz (GHz).

Most amateur radio telescopes operate in the meter wavelength range. For example, the radio telescopes described later in this series of articles will operate at a wavelength of about 2.9 meters. Using the relationship in Equation 6, the corresponding frequency is about 103 MHz.

With this perspective in mind, we will now look at the instruments used to investigate these two regions of the electromagnetic spectrum.

Short Wavelength Astronomy -

For millennia, humans were able to observe the Cosmos with only their unaided eyes. History has shown that the construction of major observatories has been a continuous practice for a wide variety of cultures of varying levels of sophistication.

However, for most of recorded time, these ancient observatories were concerned almost exclusively with astrology and not astronomy. Telescopes, as we know them today, were a relatively late addition to the complement of instruments in observatories. This is somewhat

surprising, as the technology for making glass is ancient. The Mesopotamians were the first to fuse sand and ash together to form glass. By the year 1200 B.C., the Babylonians knew how to make objects of blown glass and the Chinese were manufacturing mirrors long before the birth of Jesus Christ.

However, no one put this technology together to make a telescope until sometime in the early 1600s. Spectacles were in use in Europe by the late 1300s, and it was probably a happy accident by an obscure spectacle-maker that resulted in the first telescope.

By chance, if one aligned two lenses, one concave and the other convex, objects far away appeared to be closer. Once the first telescope was made, word traveled quickly throughout Europe - so quickly, in fact, that it was impossible to ascertain the original inventor. Most scholars now believe that the actual inventor of the telescope was Dutch spectacle maker Jan Lippershey.

On August 25, 1609, the Italian astronomer Galileo Galilei (1564-1642) demonstrated one of his first telescopes, which had a magnification factor of nine, to officials of the Venetian government. A magnification factor of nine, or 9x, means that the object being viewed appears nine times closer than it actually is.

Although he had won over the Venetian officials, Galileo did not use this new instrument to observe the heavens right away. First he designed a more stable mount, then improved the optics to raise the magnification factor to thirty.

Perhaps more importantly, Galileo had to gain confidence in this new instrument, the "telescope". In the early 1600s, the eyes were believed to be the final authority about the truth of sizes, shapes, and colors. Lenses and mirrors were known to distort images by enlarging them, reducing them, or even inverting them. Galileo spent several months and countless experiments to convince himself that what he observed through the telescope was indeed real.

Once Galileo did turn the telescope toward the night sky, humanity's view of the Universe was changed forever. His observations of the four largest moons of the planet Jupiter and their motions demonstrated without doubt that Earth was not the center of orbital motion. This observation established empirically that one body (a moon in this case) could orbit a second (Jupiter) while the second body, in turn, orbited a third body (Earth's star, the Sun). The realization that the Milky Way Galaxy was composed of countless individual stars brought forth the idea that the Universe could be infinite in extent.

The Refracting Telescope -

The telescope that Galileo used to make these startling observations was a refractor telescope. A refractor consists of an objective lens at one end of a long tube and one or more lenses (which

form the eyepiece) at the other end. Contrary to popular belief, it is the diameter of the objective and not the magnification of the eyepiece that is important in any telescope.

The primary job of any telescope is to gather as much electro-magnetic energy (in this case, visible light) as possible. An image of a far away object, say a star, is a point of light surrounded by a diffraction disk.

The resolving power of a telescope (or how much "detail" can be revealed) is dependent on the size of the diffraction disk. The smaller the diffraction disk, the more detail can be resolved. The size of the diffraction disk is, in turn, directly related to the wavelength of the electromagnetic energy (light in this case) and the diameter of the telescope objective.

In general terms, the larger the objective the smaller the diffraction disk. If the wavelength and objective diameter are measured in the same units (for example, both measured in centi-meters), then the smallest angle alpha (Greek letter) in seconds of arc that can be resolved by a lens (or mirror) of diameter "d" is given by the relationship shown in Equation 7:

alpha = 2.1 x 10 (to the fifth power) x lambda/d (arcseconds)

The formula shown in Equation 7 is called the Dawes' Criterion. It represents the theoretical resolution for a telescope. An example for telescopes of ten-centimeter (four-inch) and twenty-centimeter (eight-inch) diameter objectives may be instructive: In the examples shown in Table 1, wavelength (lambda) will be ten to the negative five centimeters (or 5,500 Angstroms - visible light in the yellow-green portion of the spectrum).

Table 1: Maximum Resolution of Optics (Dawes' Limit)

Aperture Resolution

60 mm 1.93"
3" 1.52"
4.5" 1.02"
6" 0.75"
8" 0.58"
10" 0.46"
12.5" 0.37"
16" 0.29"

From the table, a ten-centimeter (four-inch) diameter telescope has a Dawes' Limit of 1.16 seconds of arc. This means that two celestial objects separated by 1.16 seconds of arc or greater will be resolved as two separate objects. Celestial objects separated by less than 1.16 seconds of arc will not be resolved and will appear as one object.

To give you some sense of scale, the diameter of a period appearing on this screen/page is about 180 seconds of arc when viewed from a distance of nine meters (three feet). That same period would subtend a distance of 0.023 seconds of arc when viewed from a distance of 0.8 kilometers (0.5 miles). By increasing the diameter of the telescope objective, the Dawes' Limit is correspondingly decreased. This same mathematical relationship also holds for radio telescopes, as we shall see.

Telescopes larger than twenty-five centimeters (ten inches) cannot reach the Dawes limit except under exceptional seeing conditions because of turbulence in Earth's atmosphere. To achieve their true potential, methods must be employed such as speckle interferometry, which removes atmospheric blurring by analysis of many freeze-frame snapshots of an object. At the present time, the largest refracting telescope on Earth has an objective lens of one meter (forty inches) in diameter. This refractor is at the Yerkes Observatory in Williams Bay, Wisconsin. The instrument went into operation during the 1890s.

Refractor telescopes tend to be somewhat expensive due to the high cost of the objective lens. Typically, modern refractor telescopes designed for the amateur astronomer tend to have objective diameters of ten centimeters (four inches) or less.

The Reflecting Telescope -

Most modern telescopes for short wavelength (optical) astronomy are of the reflector type. Unlike the refractor, the reflector telescope uses a parabolic mirror at the bottom of a long tube rather than a lens at the front of the tube. All of the large research telescopes are reflecting telescopes, with this type also being the most popular among amateur astronomers.

The reflecting telescope was first conceived by James Gregory, a Scottish scientist, in 1663. Sir Isaac Newton, a British physicist, is generally credited with the first practical reflector telescope, which he built in 1668.

There is a fundamental problem with using a mirror to collect and focus an image. To see the image you must place your eye at the point where the electromagnetic energy is focused (called the "prime focus"). Unfortunately, your head will get in the way and you will not see anything!

Newton got around this problem by placing a small mirror at an angle in the middle of the telescope tube. This mirror deflects focused energy from the mirror to a point outside the tube. This type of reflector is called a Newtonian, in honor of its inventor.

Another type of reflecting telescope was invented by the French mathematician Guillaume Cassegrain (c.1650-1700) in 1672. Cassegrain reflectors use a small convex mirror to intercept the energy from the primary mirror and reflect it back through a hole in the primary mirror. This type of telescope has the advantage of small physical size, as the

energy path is folded inside the tube and is sometimes called a Catadi-
optric (meaning literally "many optical surfaces") telescope.

A more recent reflecting telescope design which is very popular
with amateur astronomers is the Schmidt-Cassegrain reflector. This
is a catadioptric-type reflecting telescope using a spherical primary
mirror at the bottom of the telescope tube and a lens-like corrector
plate at the front of the tube. The corrector plate compensates for
astigmatism from the spherical reflecting surface. The Cassegrain
secondary mirror is mounted to the inside surface of the Schmidt
corrector plate. This telescope type has the advantage of lower
cost (It is cheaper to make a spherical mirror than a parabolic
mirror) and small size with excellent field of view.

The energy gathered by the telescopes described so far can be
processed by our eyes. Because we can "see" the images produced by
the telescope, astronomers use the term "magnitude" to describe the
"brightness" (the amount of short wavelength energy flux, or light
energy) received from a star or other luminous body.

The system of magnitudes currently used by astronomers to denote
the brightness of stars was invented by the ancient Greek astronomer
Hipparchus (c.180-c.125 B.C.). The brightest stars Hipparchus saw in
the sky he called first magnitude stars. Those about half as bright
he called second magnitude and so on to the sixth magnitude, which
were the dimmest stars he could see. Later, when telescopes came into
use, astronomers extended the Hipparchus magnitude scale to describe
the dimmer stars that they could see in their instruments. Over time
astronomers have refined the magnitude scale so that each magnitude
difference of one corresponds to a factor of 2.512 in light energy
flux. The apparent magnitude scale is shown below:

Sun (Sol) -27
Full Moon -12
Venus -4
Sirius -2
Unaided eye limit +5 to +6
Binocular limit +10
Pluto +14
Visual limit for
large telescopes +20
Photographic limit
for large telescopes +25

One should be careful not to confuse "apparent magnitude",
which is how bright the star looks to us from Earth, with "absolute
magnitude", which is how much light energy the star is actually
producing.

The absolute magnitude of a star is the apparent magnitude it
would have if it were moved to a distance of exactly ten parsecs from
Earth. Note: One parsec is a unit of astronomical distance equal to

3.26 light years. Therefore, ten parsecs is equal to a distance of 32.6 light years. For example: If the Sun was at a distance of ten parsecs from Earth, it would have an apparent magnitude of +4.8. The absolute magnitude range of other stars varies from -10 for the brightest to +15 for the dimmest.

Now that you know about the most common instruments for short wavelength (optical) astronomy, let us next look at instruments for long wavelength (radio) astronomy.

Long Wavelength Astronomy -

Unlike optical astronomy, we humans cannot "see" energy flux at radio wavelengths. In order to process energy flux at radio wavelengths, we must use a collection device to capture the energy flux and a conversion device to convert the received energy to a form that we can readily process. Astronomers call the radio energy flux collection device an "antenna". Conversion of the received radio energy into a form that we can process is handled by a "receiver".

In most cases, radio telescopes are categorized by the type and size of the antenna used. Most of the professional radio telescopes are categorized as Large Dish Antenna ("LDA") types.

Because we can not "see" electromagnetic energy at radio wavelengths, we must devise another way to describe the "brightness" of a radio source. Instead of the term "magnitude" to denote the brightness of an energy source, radio astronomers use the term "flux density".

The basic unit of flux density is "Watts per Square meter per Hertz". However, as most radio sources are extremely small fractions of that value, the basic unit of flux density is defined as a flux unit. One flux unit is ten to the negative twenty-sixth power watt per square meter per hertz.

To give you a sense of scale, the Sun has an average flux density of ten to the fourth power or ten thousand flux units at a frequency of about 150 MHz. Earth's Moon, in contrast, has a 150-MHz flux density of only 85 flux units.

Unlike optical astronomy, the most powerful radio source in the sky is not the Sun, but an extragalactic radio source named Cassiopeia A at a 150-MHz flux density of seventeen thousand flux units!

We can think of a radio telescope as analogous to an optical telescope in the following ways: The antenna in a radio telescope is analogous to the objective lens in an optical instrument. The Receiver is analogous to the eyepiece. Keep in mind that one does not "listen" to the output from a radio telescope in the same way that you listen to a conventional radio tuned to a typical radio station. The electromagnetic energy flux detected by the radio telescope covers a very wide band of frequencies and sounds very much like static.

A conventional radio uses a radio frequency filtering system to select a very narrow range of frequencies and reject all others (as when you "tune in" a radio station).

A radio telescope receiver, on the other hand, uses a similar radio frequency filtering system, not to select a very narrow frequency band, but rather to reject narrow band frequency interference from adjacent radio services. We want the radio telescope receiver to be as wide band as possible, in order to capture as much radio energy flux as we can.

In most cases, the output from a radio telescope is converted to digital code for computer processing or, as is the case with most amateur instruments, is converted to strip chart recorder output. In this later case, the position of a line on a sheet of graph paper represents the level of radio energy flux received by the radio telescope.

We can take our optical telescope analogy one step further in describing the types of radio telescopes. Remember, there are two fundamental types of optical telescopes, the refractor and the reflector. In like fashion, there are two basic types of radio telescopes: The Multi-Element Array (MEA)-type antenna, which is roughly analogous to the optical refractor, and the Large Dish Antenna (LDA), which is roughly analogous to the optical reflector.

Radio Telescope Refractors -

The typical MEA-type antenna is based on the Yagi-Uda multi-element antenna, usually called a "Yagi", in honor of its primary inventor. A conventional television antenna is an example of a Yagi antenna. This type of energy collector concentrates incoming radio energy flux toward a collecting element (usually called a "driven element") by using electrically isolated parasitic elements in front of and behind the collecting element.

An electrically conductive feedline (usually coaxial cable) is connected to the collecting element to convey the received radio frequency energy to the receiver. Electric currents are induced in the parasitic elements by the passing electromagnetic wave.

These induced currents in turn generate wave fronts of radio frequency energy that constructively or destructively interfere with the incoming radio energy. By adjusting the spacing between the parasitic elements and the collecting element and the length of the parasitic elements, the induced wavefronts can cause incoming radio energy flux to be concentrated at the collecting element. The parasitic elements in front of the collecting element are called "directors" and the parasitic element behind the collecting element is called a "reflector".

A multi-element antenna, such as the Yagi type just described, is said to be "directive" and has "gain". That is, the antenna is most sensitive or responds most readily to incoming radio energy flux in

the direction that the directors are pointing. The term "gain" refers to the power gain of the antenna, or put another way, how much of the radio energy is concentrated toward the collecting element and is usually expressed in decibels (dB).

Another interesting antenna used in arrays is the Helical antenna invented by Dr. John Kraus of the United States in the early 1940s. This type of antenna uses a continuous antenna element in the shape of a coil or helix working against a ground plane.

A helical antenna has two characteristics that make it especially interesting for radio astronomy applications: The helix is circularly polarized (Contrast this with the Yagi antenna, which is linearly polarized), and its combination of broad bandwidth and high gain.

Unfortunately, the cross-sectional area, or aperture, of a single, multi-element antenna is rather small. The cross-sectional area, or the "effective aperture", of an antenna is not as straightforward as it might seem, but is a function of both antenna directivity and the antenna design center wavelength.

The mathematical relationship called Dawes' Criterion also applies to radio astronomy as well as the optical branch. As we have learned earlier, an optical telescope with an aperture (objective lens diameter) of ten centimeters (four inches) can resolve an astronomical object to within about one arcsecond.

The primary difficulty with radio telescopes is that the wave-length of radio energy is much greater than that for visible light energy. For example: Radio energy at a wavelength of twenty centimeters is roughly 400,000 times longer than the wavelength of visible light. As a result, to resolve the same angle of one arcsecond at a wavelength of twenty centimeters, a radio telescope would have to be nearly forty kilometers (24.8 miles) in diameter.

Fortunately, there are ways around this problem which will be discussed later. How much detail a radio telescope can resolve is a function of its "beamwidth". The "beam" is a cone-shaped bundle of radio energy of such an angular size that within it details cannot be resolved. The beam width would correspond in optical astronomy to the angular size of the central diffraction disk of a stellar image.

For a large optical telescope, that size would be roughly a few hundredths of a second of arc, but for a typical large radio telescope, the beam width is on the order of several minutes of arc. The beam width of a typical single multi-element Yagi antenna (similar to what may be used in a small amateur radio telescope), for example, is on the order of fifteen degrees! However, by connecting a large number of multi-element antennas together electrically in phase, the beam width can be reduced to about one to two degrees - still a far cry from one to two arc seconds!

The size of the antenna beam depends to a large degree on the wavelength. In general, the shorter the wavelength (the higher the frequency) the smaller the antenna beam. One way around the problem of large beamwidth is to use a techniques called "interferometry". In this technique, two identical radio telescope antennas are placed some distance apart. Incoming radio energy flux will strike one antenna a brief instant before the other one so that the two antennas will receive the same energy at slightly different times and thus will be "out of phase" with each other. The difference in phase between the two antennas can be measured electronically.

Because this phase difference depends on the angle of the radio source relative to the antennas, positional information on the radio source can be readily obtained with this technique. One of the projects to be discussed in this series is a two-station radio interferometer.

Radio Telescope Reflectors -

In an effort to reduce antenna beamwidth and improve the sensitivity of a radio telescope to weak sources of radio energy flux, radio astronomers shorten the radio wavelength at which they will observe and employ large reflecting "dish" antennas to collect and concentrate the radio energy. The form of these reflecting radio telescopes closely follows the form of their optical counterparts. It is interesting to note that the highest gain antenna on Earth (148 dB) is the five-meter (two hundred-inch) telescope on Mount Palomar in California. The very short wavelength of light energy causes such a high gain to be realized.

One of the most common radio telescope reflectors is the "Prime Focus" arrangement In this radio telescope configuration, the receiver is located at the prime focus. Another common radio telescope reflector arrangement is the Cassegrain system. This arrangement is similar to its optical counterpart in that a primary parabolic reflector and a convex secondary reflector are used to "fold" the radio energy path. This arrangement has the advantage of slightly smaller size and placement of the receiver where it is easier to adjust and service. The Cassegrain system (and its cousin, the Gregorian system, which uses a concave rather than a convex subreflector) is usually only used in very short wavelength radio astronomy (centimeter wavelengths and shorter). As the radio wavelength gets larger, the size of the sub-reflector must also get larger. A point is soon reached where the amount of energy blockage caused by the sub-reflector negates any advantage of the system.

Summary -

Speaking in general terms, both optical and radio astronomy are observing the same thing: Electromagnetic energy. The primary difference is the wavelength of the electromagnetic energy: Optical wavelengths being very short and radio wavelengths being very long. Since we can "see" optical wavelengths as visible light, our brain can

be used in conjunction with our eyes to process information gathered by the telescope. Because we can not see in radio wavelengths, we typically use electronic devices to process the received energy collected by a radio telescope and convert it to a form that we can then "see". Astronomically speaking, the primary advantage of radio astronomy is its ability to detect energy sources hidden behind dark obscuring matter. This dark matter blocks the shorter wavelengths of visible light, but the longer wavelengths of radio energy are able to pass through the dark matter.

Another application of this characteristic of radio energy is Radar Astronomy. In this application, a high energy pulse of electromagnetic energy, at radio wavelengths, is directed toward an astronomical object. The reflected energy is then used to deduce details about that object. For example, the surface of the planet Venus is hidden from view at optical wavelengths by the planet's thick obscuring clouds. By using radar astronomy, we have been able to create computer-generated images of what the surface of cloud-covered Venus looks like. Radar astronomy has also recently been used to study the surface of the planet Saturn's largest moon, Titan, which is shrouded in thick orange clouds of nitrogen and methane.

Although radio astronomy has been a relatively late addition to the discipline of astronomy, it serves as a valuable "second eye" into the Cosmos. Because radio astronomy is a relatively young discipline, it offers the amateur radio astronomer a unique opportunity to work alongside the professional astronomical community to make valuable contributions to science. Future articles in EJASA will describe how to construct small, relatively inexpensive radio telescopes for use by amateur radio astronomers.

Editor's Note -

ASA members Bill Black and Jeff Lichtman coordinate a Radio Astronomy Interest Group for those who wish to pursue this important branch of observational astronomy. Both men operate their own radio telescopes: Bill's instrument detects meteors by reflection of distant television stations from ionized trails in the upper atmosphere. Jeff's dish measures intensities of variable sources. Low-cost availability of computers and radio components has opened the doors for amateur participation in this field. If you wish to learn more about the RAIG, please contact the ASA at one of the addresses listed in this EJASA.

Jeff is also President of the national Society of Amateur Radio Astronomers (SARA), an organization of nearly 250 radio hobbyists. For more information on SARA, please contact Jeff at the following address:

1425 Parkmont Drive
Roswell, Georgia 30076
Telephone: (404) 992-4959

3363. June VHF QSO Party

Newsgroup: rec.ham-radio
Date: 1990-06-05 19:35:26 UTC
From: Joel_Glickman@MTS.RPI.EDU
Message-ID: <1838219@MTS.RPI.EDU>
Source record: 11165

```
**********************************************
* June VHF QSO Party *
**********************************************

W2SZ/1 will operate a multi-op station
high atop Mt. Greylock in Adams, Massachusetts.
Our location is:

Grid: FN32
Elevation: 3491 ft.
Latitude: 42.6364 degrees
Longitude: 73.1667 degrees

We will have active stations on *all* bands up
to 24 GHz. If you would like to sked a contact,
please E-mail me by 4:00pm Thursday afternoon.

We shall be on the calling frequencies of
903.100 Mhz and 1296.100 Mhz for the most part,
and you can establish contact to make a sked
for microwave contacts there if needed. We can
also be reached at * 518-864-5472 * during the
contest.

On the higher bands, we can be worked at:
2304.020 Mhz
3456.020 Mhz
5760.020 Mhz
10368.020 Mhz

We will of course be operating 6 meters, 2m,
220, and 432 stations. If you hear us on any
of these bands, give us a call and make a
sked for a higher band if you can.

*Everyone* can join in on the fun. It is,
after all, a QSO *Party*! If you have an FM
rig with 2 meters, 220, or 440 capabilities,
look for us on the following FM simplex freqs.
146.550 Mhz
223.500 Mhz
446.000 Mhz

**********************************************
See you on the air guys.......
```

Last night I worked an OMxxx who said to "qsl via the buro". There
has been enough here about how managers work, but how about bureaus?

Do I mail my card to his bureau with IRC, or does he reply to the US bureau?

My callbook lists OL and ON as Czechoslovakia and Belgium with OM
allocated to the Czechs but none issued yet, so unless I hear
different, I will assume it is Czech.

In lrj@helios.tn.cornell.edu Lewis R. Jansen writes

>I put an Ohm meter across the mic terminals (with the mic disconnected
>and saw ~500 ohm impedance.

Impedance is a term that is associated with AC circuits. An ohm-meter is
a DC circuit instrument. Although the term "ohms" is used as the unit of
measurement of resistance and impedance, the two are not synonymous. An
ohm=meter cannot measure impedance *UNLESS* you are positive that what you
are calling impedance is a pure resistance.

If there is a capacitance or inductance anywhere in the circuit path you were
measuring, the impedance could be far different from the resistance you saw on
the meter. Note that the formula for impedance (Z) includes resistance,
capacitance and inductance:

/---------------
Z = sqrt (R-square + (XL - XC))

If by keying the transmitter you get a different-from-normal reading with
NO modulation, I would doubt that the input and mike impedances would be a
consideration. It would be better to know what the pin-outs of the mike are
compared to what the rig's mike connector wants to see. Sounds more like
a keying-line problem to me. I'd double check the connector wiring for the
mike against the FT-101 schematic.

Errata the formula above should have read:

Z = sqrt (R squared + (XL - XC) squared)

>

Yes and no. You don't need the IRC; just mail the card. However, that's still
a 45c stamp. If you're a big gun and work 1000+ DX stations a month, then you
may want to speed up your replies by bundling all your Russian QSL's, etc.
and sending them to the buros yourself.

The other method, for everyone else (like you & me) is to use the ARRL's
Outgoing Buro. If you're a League member, the details are in QST every few
months or so. Basically you sort your cards by prefix, mail 'em to Newington
with $2 per pound, and *they* send the mail sacks overseas. You gotta be a
member to use it. If that doesn't seem fair, remember that most DX stations
have to be a member of their League to even get *incoming* cards.

Your modem requires telephone line levels of +30 to +36 dBm??!!?!? I don't
think so. You must be thinking of the ON HOOK DC from the PBX or Central
Office....not the AC signal levels on the line.

With a California trip fast approaching, and plans to be in
Sacramento, San Francisco and Los Angeles over a 3 and 1/2
week period, I hope to do some operating on 2 meters. Does
anyone have a listing of OPEN repeaters for these areas? I'm
told by some people who've been to these areas that there are
a lot of closed repeaters and that it's very difficult to find
many that are open to all users.
Also as most of my time will be spent in the Sacramento and
San Francisco areas, I plan on doing a little shopping as well.
I hope to trade in my ICOM micro 2AT on a 2SAT, and possibly
pick up a couple of other goodies (good second hand if I can
find it).
So would anyone have any recommendations on Ham Stores in
Sacramento particularly??
Please E-Mail
Thanks in advance.

I have the honor of knowing the officer in charge of that test... what happened was that they were running a test and hooked up the input that was simulating missles coming over the pole, but someone forgot to unplug the outputs to the Early Warning System. Most of the stations on the East and West Coast ignored the war message, but middle America wet it's pants. The guy I know didn't have enough rank to get fired for the screw-up, so they fired his boss.

It's a great story -- it might even be true. You know what military stories are like...

The mic element had been removed from the PTT/mic assembly and the
leads had been desoldered. I put the ohm meter across the two
terminals and got the above reading. The mic element is from the
mid 1970's, and is ~3/4 inch thick and ~1 inch in diameter.
Interestingly, it's identical to the mic element in a 1976 Midland CB
radio I have (I wanted to make sure that the mic element in the Yaesu
mic wasn't bad; the Midland was known to work). There may be
something other than pure resistance in there, but I don't have the
equipment to really check for it.

>If by keying the transmitter you get a different-from-normal reading with

I think I stated that the readings were normal for no modulation,
but that the meters weren't reading anything signifigant when
modulation was applied.

Checking the wiring on the mic and making sure it matched what the
FT-101 wanted was the *FIRST* thing I did. Additionally, I *did* have
a local QSO with a couple people despite the meters reading no output
power (they *do* read appropriate value when tuning up into a dummy
load or doing CW). This would indicate that the mic & PTT are working
normally; for some reason the meters aren't catching it...

>Regards,
>73,
>Dube Todd N5PDK

Based on some more testing into a dummy load, and the input of a couple people on the net, I get the impression that the meters on the FT-101 and the Drake MN7 are too *SLOW* to provide accurate readings on the upper HF bands. All was working as it was supposed to be in the lower HF bands (at least to the Cantenna... :)

I'll borrow a good wattmeter (comparable to Bird) from the Cornell ARC and do some more checking tonight. Now for 10m to open up... *sigh*

Anyway thanks for the input, Dube; hope to catch you on the air sometime.

3376. VHF/UHF/EME Dxpedition to Azores

Newsgroup: rec.ham-radio
Date: 1990-06-06 16:58:00 UTC
From: ka1gt@cbnewsm.att.com
Message-ID: <1990Jun6.165800.1752@cbnewsm.att.com>
Source record: 11089

I received a letter from F6EZV this morning. The following is a condensed version of the contents:

The F6KSX group has mounted previous Dxpeditions for 432MHz EME to C30BVA and TK4EME. This year they will be operating from CU8EME in the Azores. (Locator HM49JN). Operation will be as follows:-

July 10-17 144MHz MS/ES/Tropo 144.025MHz 17el, 1kW, 0.4dB NF
July 12-17 432MHz EME 16x21el, 1kW, 0.3dB NF
July 18-22 144MHz EME/MS/ES/Tropo 144.025MHz 4x17el, 1.2kW, 0.3dB NF
July 10-22 HF VHF net 14.345MHz for skeds

They are looking for skeds. They would like to try for the 1st EU/NA contact by other than EME (i.e. E-skip, Meteor scatter or tropo.

Contact Alain Bironneau (F6EZV), 8, imp des Perdix, 94 210 La Varenne, France

The group will be F1EHN, F6CTW, F6EZV and F6HKA

For those not familar with the Azores, they are a group of islands about 1000 miles west of Lisbon. The distance to the closest point in NA (the eastern tip of Newfoundland) is about 1500 miles. The distance to the eastern seaboard of the USA is about 2000 miles (Maine) to 3000 miles (FL).

Please pass this info on to anyone with well equiped stations, especially to anyone in Newfoundland or Nova Scotia who might have a chance for a non EME contact.

Subject: Identify old radio?

My wife's great uncle is closing his home and moving into an apartment with his widowed sister; I have an opportunity to pick up a floor model Delco 3-band radio (don't know if it's currently working, but I bet the electrolytics are all shot!). Can anyone tell me anything about this from this meager discription:

DELCO R-1131, S/N 019293, "Delco Super Heterodyne Receiver," 3 bands (.55-1.610, ~1.7-~5.5, ~5.5-~18 MHz). Couldn't find a date on the S/N plaque on the back, might be one inside on the tube layout chart, but it was too dusty and we were moving other stuff that weekend, so I couldn't linger...but we're going back for a second load!

Thanks for any info.

>a single OK/LA/ON/OH, etc was heard. Even more dissappointing not a single JA
>was heard... Did any of the rest of you experience a similar WPX contest?
>
I knew the conditions were bad enough that I didn't even bother trying to
work this one. So I took off driving (ugh!) to Seattle to see some visiting
Russian hams I know who were visiting with the Western Washington DX Club.
It turned out that the main guy I had gone up to see--UA3ABW--had gone over
to Vancouver to work WPX as a VE7 (he could get permission to operate from
Canada, but of course in the U.S. it's not quite so simple). He went up with
KE7V, who is quite a good contester, and they did a multi-single entry. Net
for the two of them for the whole weekend was about 800 qso's. Not bad
considering the conditions, but on the grand scale of contesting that's pretty
miserable. Knowing KE7V as I do, that will probably be one of the higher
scores recorded.

3383. PRO-200[4,5] Birdies

Newsgroup: rec.ham-radio
Date: 1990-06-06 21:48:19 UTC
From: paul@hpldola.HP.COM
Message-ID: <12120037@hpldola.HP.COM>
Source record: 11098

I have a problem with birdies on my PRO-2004 and have seen this on other 2004's and 2005's but it's not listed in the birdie table.

They occur every 2MHz on the odd MHz at *.750 - that is, 453.750, 455.750 and so forth. I've checked high and low freqs and it seems to be everywhere so I guess it's getting into an internal mixer or something. Since 453.750 is a local police freqency this is a real problem.

Anyone know where this comes from and/or how to fix it? I'm not shy about minor scanner hacking.

Message-ID: <9006070028.AA04973@ucsd.edu>
Source record: 11091

Before the miss conception is taken as law on field day:

Under bonus points #8 of field day rules it clearly states that for packet radio rule 7C is waived!! Rule 7C states no repeater contacts. Therefore the no repeater rule is not in effect for the packet station during field day. The same rules were in effect last year with the result being contest policemen tell you that QSO's digipeated thru them were no good so stop it.
Repeaters on other modes are not allowed, PACKET is the exception!

Hmm.. The story I remember from the "old days" was that a technicial at the NORAD HQ made a boo-boo, as the alert message to Radio Stations (at that time) was by TELETYPE, and there were two pre-punched tapes (remember punch-tape?) at his console, one "test", one "we're at war, let them know"... and one day, he accidentally sent the REAL war tape instead of the test, with all the right authenticators in it. As was noted before, most radio stations ignored the message (on air, anyway) (makes you real sure of the local radio stn's concern for your stress level, eh?), but a few did tell their listeners that the war was on. Supposedly, subsiquently the system was changed to avoid this happening again, thru more "human in loop" design.

Message-ID: <9006071242.AA21383@decpa.pa.dec.com>
Source record: 11094

My understanding from talking to a former radio station employee is that there are/were two classes of stations (primary and secondary - my terms).

The secondary stations, in the event of an emergency, tuned to one of the primary stations and rebroadcast it. The EBS equipment rack included tone detection, etc. and a specially packaged AM radio (not mil-spec, though, supposedly of lower quality than the cheapest auto AM radios).

Primary stations would supposedly have the tapes "telling you what to do", as well as feeds from "official sources".

I think this is why there is divergent opionion in this discussion from knowledgeable radio station people - the EBS implementation varied, depending on what kind of station it was installed in.

A couple of years ago I bought a Radio-Shack 24-hour digital clock
with a *BIG* display.
Radio-Shack stopped selling this beast, but a local discount
store is offering a remarkably similar clock that only
provides 12-hour display. It turns out that they both use
the same display, and electronics--namely the TMS3450
clock chip.
I tried to get information out of Texas Instruments on this chip,
but they steadfastly refused to acknowledge its existence.
The chips have the TI logo on them, and they use the TMS
numbering scheme characteristic of TI.
Can anybody (TI, are you listening??) give me any information on this
chip--I would like to modify the twelve-hour version of the clock
to twenty-four. I almost have it, but I need some info about the
chip.

While the FD rules don't allow voice repeater QSOs, they specifically allow DIGIPEATED QSOs. I assume that this includes THEnet and Net/ROM repeated contacts.

Message-ID: <9006071545.AA17103@ucsd.edu>
Source record: 11099

We've been discussing this topic like we all know what we're talking about, but I know that's not true in my case... :-)

Anyway, how about some basic info? I know what a QSL card is, and understand hams exchanging them directly. But when we get into the infrastructure of all these extensions and enhancements that have been build up around this simple exchange, I really don't understand what the details are.

Just who is a "QSL Manager"? Who takes on such a job and why? Are they "appointed" by a foreign ham, and are there people clamoring to get these positions, or are they people who volunteer to experience drudgery and annoyance for the sake of a foreign ham who is a personal friend, or what? Is the usual thing that one person is a "QSL Manager" for many foreign hams, or is this a one-to-one thing normally? Are there "QSL Managers" outside the US, or is this something that is US-unique?

What is a "bureau"? Who runs it/them, and why? Does each country have one? Do they have any "official" status, like being registered with that country's FCC-equivalent?

When did this stuff start? Any history notes or comments?

Post responses, don't mail them; this should be of interest to all the people out there who post "how can I become a ham?" or similar new-guy type queries.

[Someone writing a comprehensive reply to this would have more than half the work done on the QSL article for CQ magazine that I mentioned in a posting a week or so ago... Hint, hint, nudge, nudge... :-)]

I worked at a secondary station (KANU-FM, Lawrence, Ks) in the late '60s.
We had the sealed envelopes and the authenticators. Our EBS warning was
given by detecting a carrier drop from a primary station. This would
cause our EBS receiver (an ordinary radio, that was rack mounted) to
go off. We had no standard method for rebroadcasting the primary.

Bureaus are set up to reduce postage costs for overseas QSL's. From looking
in the call book, most of them are run by some radio club; most likely
that countries equivalent of ARRL (who runs the US bureau). The idea
is that if you do a lot of DX, you can send a bunch of cards at once
with some money to ARRL. They put all the cards for Lower Slobovia
in one package and send it off. The Slobovian bureau then puts all the
cards for an individual ham into his SASE (or however they arrange it)
and send it to him. It is much cheaper to ship a box of cards by the
pound then to put a stamp on each one and mail it.

You have to be a member of ARRL to use their service for outgoing cards.
If you aren't in the ARRL, you should be able to mail direct to a foreign
bureau. The addresses are in the foreign callbook.

This is a bit more than I knew when I posted my question about bureaus.
The big thing I still need is the details of assuring that the return card
gets to me from ARRL. Where do I send my SASE or do they want money, etc?

]and so forth. I've checked high and low freqs and it seems to be everywhere
]so I guess it's getting into an internal mixer or something. Since 453.750
]is a local police freqency this is a real problem.
]
]Anyone know where this comes from and/or how to fix it? I'm not shy about
]minor scanner hacking.
]
I can tell you where it comes from, but not how to fix it. You have
a strong signal coming in from a UHF station (I think channel 21). This
signal mixes with the 2nd LO. When the second LO is tuned to *.750,
the mix gets into the 2nd IF.

From memory, the frequencies involved are:
1st IF 610-612 MHz (or was it 608-610). LO about 75 MHz lower.
TV station 75 MHz lower than that (you are hearing the audio subcarrier
of the TV which is always at a *.750 frequency).

I have the same problem, and am locate 15 miles from the UHF station.

3401. CB in GB

Newsgroup: rec.ham-radio
Date: 1990-06-07 17:28:50 UTC
From: jim@foobar.hf.intel.com
Message-ID: <418@foobar.hf.intel.com>
Source record: 11112

I have obtained an FM CB radio at recent hamfest. It covers 26-28 Mhz
in 40 channel steps, is powered by 240v. 50hz, and outputs about 4 watts
of frequency modulated carrier. I intend to convert it to cover frequencies
on or around 29.6 Mhz. It uses the Motorola MC145106 PLL chip.
The seller said it was a CB radio from England. Is this correct? Besides
the wider band coverage, the FM aspect intrigues me. I wish it was this
way in the U.S. Instead of all the heterodynes, imagine how peaceful a
"silent pileup" might be.

>week period, I hope to do some operating on 2 meters. Does
>anyone have a listing of OPEN repeaters for these areas?

There are hundreds and hundreds of them. I'd suggest you get an
ARRL Repeater Directory. If you can't buy one in your area, try to
get to a ham store as soon as you get to California.

>I'm told by some people who've been to these areas that there are
>a lot of closed repeaters and that it's very difficult to find
>many that are open to all users.

This isn't true on 2m here in Northern California! There are very few
closed 2m repeaters. And most of the "closed" 440 MHz systems only use
tone access because of intermod problems, not because of a desire to
exclude people. They mostly use a 100Hz tone.

>Also as most of my time will be spent in the Sacramento and
>San Francisco areas, I plan on doing a little shopping as well.
>I hope to trade in my ICOM micro 2AT on a 2SAT, and possibly

3405. Re Battery packs

Newsgroup: rec.ham-radio
Date: 1990-06-07 18:56:24 UTC
From: Joel_Rossbach.HENR801c@XEROX.COM
Message-ID: <900607-120840-1696@Xerox>
Source record: 11106

Greetings,

I recently purchased a Yeasu FT 470, along with various accessories, at the Rochester, NY Hamfest. This HT was purchased, primarily, for my wife's use. We are quite impressed with the quality, features, and price.

Anyhow, about the battery pack, I have not had occasion to attempt to open the NiCad packs, as they are brand new. We have a pair of FNB-17 packs which may not be constructed similarly to the FNB-12. However, the FBA-17 Alkaline Cell Pack appears to be of the same external construction as the FNB-17 NiCad packs. I would expect that they probably open in the same general manner. The NiCad packs may be cemented together, but that may be a minor complication.

The FBA-17 is opened by gently prying up the tab between the rails on top of the pack then seperating the two halves from the top. There is an interlocking hinge at the bottom of the pack. Reassembly consists of mating the interlocking parts at the bottom and swinging the two halves back together until the top latch snaps.

I suspect that the FNB-17 could be opened in the same manner. There is a label between the top rails which covers what appears to be the same sort of locking tab as on the FBA-17. The FNB-17 may be cemented, hopefully not ultrasonically welded, together. If they are, a thin XActo knife may be usefull to gently seperate the seam, but be careful not to destroy the interlocking hinge at the bottom.

Hope the wordy information helps. I would recommend that the entior battery insert be replaced with one from a reputable supplier. The replacement of individual cells may appear to be financially prudent in the short term, but will probably result in the necessity to reenter the pack numerous times as the other cells die and the capacity will not be as great as with a new set of matched cells. Enough rambling!

Good Luck, 73,
Joel, N2EZV

3406. Special Event: WIARC 50th anniversary

Announcement for Quincy, IL, and sister city Herford, West Germany,
special event between June 25 and July 1:

To celebrate Quincy German Festival Days and the 50th anniversary of
the Western Illinois Amateur Radio Club, members of the WIARC and the
Herford ARC will operate club stations W9AWE and DK0HF (respectively)
as well as their individual stations, June 25 through July 1. SSB
operation will be on all bands 15 kHz above the bottom of the General
class segment and the bottom of the 10 m Novice segment. CW will be 35
kHz above the bottom of the CW segment. Emphasis will be on the 20,
15, and 10 meter bands when these bands are open into Germany. For a
certificate, QSL with a #10 SASE to WIARC, Box 3132, Quincy, IL 62301.
A special sister city endorsement will be added to certificates for
stations contacting both a Quincy and a Herford station.

>
> Here is some of the "interesting" information. The so-called "modification"
> to enable the wide range RECEIVE ONLY frequency converage did NOT require
> any hardware changes to the unit.... (a FEW early units did require a diode
> to be removed)... simply hold down a few buttons when turning on the unit and
> keep them held until the unit is done with it's self test (Light-B-#).
>

Well, to be adventuresome, I tried the "light-B-#" on my IC-2SAT.
I didn't get wide-range receive coverage, but I did get ALL the
LCD segments to turn on right after I powered the rig up.
None of the other key combinations that NM1D noted seemed to have
any effect.

So, are the digital processors the same? Can these "software"
changes be applied to other Icom handhelds? Has anyone found
useful key combinations?

Here's a brief note about converting those 12 H LED clocks to 24 H. I was going to buy a Radio Shack 24Hr clock untill I noticed a local discount store had the exact same clock (less the 24/12Hr switch) for about $5. It didn't take too long to figure out the little solder pads for the options (12/24Hr and 50/60 Hz). Lo and behold, when I turned it on I discovered that the LED display had only enough segments for 18:88. They actually left the other led's off the display module! It does still work, though.

As FM gets narrower and narrower, the stronger station has to be stronger
and stronger to capture the receiver. At some point it cannot be done.
While FM with the deviation we use is certainly better than AM, it also
comes from a tradeoff of bandwidth.

>Radio-Shack stopped selling this beast, but a local discount

It might interest you to know that radio shack DOES still have such a clock available - the model number is 63-805B. It has switch selectable 24 time, a battery backup (it is 110volt powered), and 1.8" red LED's. I know - I just bought one today. Cost was very reasonable, about $22.

This is not just an old one either, because the manual in the box has a 1989 date on it. I suggest that you go back to your local shack and holler....although I don't know if Canadian shacks sell different stuff. I think you said you were from Canada, right? If so, perhaps a trip across the border would be well advised.

I have a low door and have two glass mounts on the back window of
my Subaru wagon. The 2M element is mounted at the bottom of the back
window, which is slanted, so the element stands away from the glass,
completely vertical. The Larsen whips are pretty flexible and take
a lot of abuse. SWR is less than 2:1 although the 2 whips affect
each other. I regulary hear the tips of the whip scraping on
my garage door as I drive under it. I get about a year life
out of the whip, although I haven't worn one out yet, just
done something stupid instead.

3413. Phone line low voltage and poor audio problem

Newsgroup: rec.ham-radio
Date: 1990-06-08 04:36:03 UTC
From: mikey@pnet01.cts.com
Message-ID: <3043@crash.cts.com>
Source record: 11119

I been going around and around with Pacific Telephone with a nebulous "low audio level" problem and have'nt got it fixed yet in 3 attempts over the last few months.

I have a repeater autopatch and personal phone lines comming into my residence. Both lines are sitting at 17-22 volts on-hook and 4.4-4.6 volts off-hook using a Western Electric model 2500D telephone set (standard TT desk phone). My understanding of the phone system is limitted but I would expect to have 45-51 volts at the service block. I called the 611 repair to complain about this low audio problem. The rep called back and told me that I have a short on my inside wiring. So I removed the modular plug from the service block (this removes the inside wiring form the incomming service line) and took my 2500D set outside to the service block and made the following measurements:

line 1: off-hook 4.33 volts @ 23.7 mA = .1026 watts

line 2: off-hook 4.28 volts @ 23.9 mA = .1023 watts

I checked the on-hook voltage at a neighbors residence and it was 46.3 volts. I called a friend in a distant community and he had 51.2 volts/51.5 volts and 10.6 volts/10.6 volts on his 2 lines on-hook/off-hook. These 3 lines appear to be normal.

The service rep response to this voltage comparison was that "the company doesn't gaurantee the line voltage. I said that some of my jap track phones (line powered) won't dial and decode properly on my lines but work fine at other residences. She said that she would have a tech respond but that it would cost $35 min if the fault were mine. I said that the situation was unacceptable and send 'em out.

Well, a few hours later, my wife gets a call from a different person saying that the problem was a faultly splice. That everything was fine now. No one ever came to our house. As I had left for work, I heard about this later. I rechecked the 2 lines again, both were still at 22 volts. It appears that the bad splice (singular) had no effect and the audio on both lines is still poor.

The (unknown) rep called the following day and left a msg on the recorder asking if our phone was OK now. Did'nt leave a name/number. So problem is not resolved.

Any thoughts or hints on how to prod a big baby bell into some real service?

Well, they're 95 cents here in Tulsa, so maybe its really your post office that is confused. Unfortunately, an airmail reply from most countries takes 2, 3 or even 4 irc's. There is a table in the Callbook with this information. Since a greenstamp appears to be convertible to first class airmail postage *almost* everywhere, that's what I use. In some countries though, its illegal for the residents to have foreign currency. To be on the safe side, I check the 'Greenstamp Guide' published by DX QSL Associates first. It lists countries where greenstamps are ok. DX QSL Associates also sells 'European' airmail envelopes and foreign stamps. The prices seem a little high, but you don't need a big supply of either. I've been having very good returns on Soviet QSL's using the appropriate stamps, with some cards coming in only 30 days after the QSO. I don't stock up on stamps though - postal rates change more often in some parts of the world. I recently received a card from Cyprus and the op had added stamps beside mine. Fortunately, I had included a 'cheap' irc as well - I *really* needed a 5B card ;-) Rarely, a country is is not listed in either the Callbook irc table or the 'guide' (9Y Trinidad comes to mind). In that case, I stick to ircs.

3418. RECEIVER

Newsgroup: rec.ham-radio
Date: 1990-06-08 15:43:00 UTC
From: greg.trice@canremote.uucp
Message-ID: <79e293caa7ff266fe3a4@canremote.uucp>
Source record: 11123

I'm looking for a receiver with the following specs. If they seem a
little unusual, it's because it's not for communication, but rather used
in connection with magnetic resonance experiments.
Frequency coverage 100-1000MHz (continuous, not channelized)
Bandwidth adjustable from 500Hz to 50kHz (can be in steps)
Must have bfo (signals are akin to cw transmissions)
Sensitivity of 0.5uV
Ability to withstand 1000V pulses on input without blocking or damage.
The receiver will operate in an environment of very high EMI including
huge pulsed magnetic fields.
If nothing like this exists on the market I will design and build one,
but I'd prefer to buy.

3419. Teletype Station at 14.024 MHz

Source record: 11125

[NOTE: Message modified, SYLVAN KATZ, 08 Jun 90 10:35:14]
Does anyone know if the teletype station that has been continuously transmitting at 14.024 MHz is a commercial station. From this QTH the signal seems to come from over the pole (beam heading a little west of north). I can hear the transmission 24 hours a day and the signal is S9 at this location even when there are no openings to europe. My QTH is about 250 miles north of the North Dakota/Canada border.

>From: VE3WZL@VE3WZL
>To: ALL@VE3GYQ
Subject: TM-731A RPTR & OUT-OF-BAND MODS
Path: N8HTG!VE3WZL

Thanks to the efforts of our local technical wizard, Bob VE3GVD, we now have the secret to making the new Kenwood TM-731A do the same fancy tricks that its sister rig the TM-721A did. Here is how it's done:

1) Remove the top and bottom covers, and take out the screws that will allow the front panel assembly to swing down.

2) With the rigs front facing you and the top side up, locate R 121 and R 125 which are both immediately to the left of the lithium battery.

3) Using a low wattage iron and tweezers, remove R 121 which is about the seven o'clock position with respect to the battery and reinstall it in the blank position designated for R 125 which is about the eight-thirty position with respect to the battery.

4) Now locate R 25 on the back of the circuit board that is attached vertically to the main chassis. (It's the board behind the front panel when the panel is folded up) Carefully un-solder and lift off the grounded end.

That completes the mod. Having a service manual, or at least a board layout will assist you in locating the components. It will be neccessary to do a reset on the microprocessor as described in the user manual after doing the mods described.

For those curious as to what does what, removing R 121 enables the repeater cross-band function, and the adding of R 125/removal of R 25 enables the out-of-band features.

>trouble either using plain ax.25 or KISS mode.
>

I've breadboarded both the 2211 and 7910 modems. Well, well, the things you can get away with :-). The XR-2211 Carrier Detect circuit is pretty good. Essentially, it is "true" (1) when the PLL has locked onto a signal. If you use a large enough filter capacitor (Cd in the Exar app notes) the Carrier Detect will work pretty well, with a few notes:

1. It will trigger on any kind of coherent signal in the PLL lock range. A steady tone will trigger it (my TR-2600A HT makes a beep when you push a keypad button... this triggers it). This is essentially OK. I don't think the TAPR mod will affect this behavior.

2. A signal may fade briefly. This may cause CD to drop, and the otherwise good packet may be dropped. This will be more of a problem on HF. The problem is worse when running with persistance (like in KISS mode). If the TNC wants to transmit and is deferring to an active channel, the chance of him transmitting during other traffic is increased. The TAPR mod is said to improve this considerably.

The Am7910 is not as good. The CD output on that chip seems to be most sensitive to signal amplitude. Turn your squelch off, and DCD will always be on when the volume is at a good level for data. This keeps your TNC really busy receiving and throwing away bogus packets. Furthermore, the TNC may defer to an empty channel. Ughh.

I've ordered the State Machine DCD upgrade for my PK-88... this is supposed to trigger on actual valid looking data. This is probably the optimum for VHF use.

>73

I love this stuff. One of my friends at home and I have done a little of this ourselves. He has a radar gun, and when the thought crosses our mind, we pull it out and play with it. The funnest thing was as you said setting off peoples' detectors. My friend, who is a commuter student there and therefore spends his life on the freeway has done this a lot more than I have. I've only seen it work one. Just not that many people have detectors.

This is one of the funniest things he's done. He saw some new slick looking car in the next lane going by, and noticed a curly wire coming down from one of it's sunvisors. Radar detector! He immediately got out the radar gun and took aim. The first thing to do is to switch it on and watch a row of LED's suddenly light up <zzzzzip!> The next thing he did was, using the "trigger switch" he switched the transmitter on and off repeatedly. The driver looked at the detector funny, adjusted knobs, smacked the thing around a little, etc and no doubt turned it off soon thereafter. Beautiful.

He got the thing mail order somewhere. It is a late model thing, that can measure speeds of other cars, even while the car it's in is moving. One guy he knows in AFROTC who he showed it to is in Explorers police division. He took a look at the thing and said, "You know, you have better equipment than the cops do?"

What is this source you mention? Also what are the deals with licensing with them? X band is just outside one of the microwave ham bands. We've never really worried about it. The most credible thing I've heard as a requirement is a Restricted Radiotelephone Operator's Permit, which we both have anyway.

On the subject of points for packet radio contacts during field day:

(Please note that I am not on packet radio at all, the current bandwidth isn't high enough to interest me. I'm a snob I guess.)

I feel that points should also be awarded to all stations that are used as "repeater" stations. If points are not awarded for this, then people will try to prohibit others from using their stations as repeaters. This is a self-defeating concept, as networking (the big advantage to packet radio) can't happen under these hostile conditions. (I'm not commenting about the current technology, just the idea that station owners might try to prohibit others from using their sites.)

Also, I think that some people have published papers showing great advantages of full duplex repeaters for packet use. Why prohibit this technology during field day, if it is superior? (Oh well, nobody ever accused the league of sanity or intelligence. Here's just another example of how the league is impeding progress.)

We've just completed the beta-test version of The 440 Spoiler for controling Kenwood TS-440S transceivers. Version two incorporates high density display (color if you want it), total control of tuning by keypad, combined scanning of memory groups and frequency ranges, and more robust communication-port handling. You can now control a 440 from your PC sitting next to it or across the nation from it (through whatever voice and data paths you devise external to the program).

The package is shareware, and it's available on landline BBS ECHO (education) at 806-741-1570. Leave me a comment when you call to register, and I'll see that you're upgraded to download within a few hours.

I'll be happy to make you a copy of the package if you'll be so kind as to send me SASE (like a diskette mailer) and a formatted diskette.

Beta (user) testing lasts through June, and I would be very delighted to get bug reports or feasible suggestions for improvements during the beta-test period.

3426. USA ham call words

Newsgroup: rec.ham-radio
Date: 1990-06-09 04:38:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500568@ux1.cso.uiuc.edu>
Source record: 11032

This list is by no means complete, as it is based on /usr/dict/words which
is certainly not complete. Note that 1 might be I or L.

3428. Field Day Logging Program Available

Newsgroup: rec.ham-radio
Date: 1990-06-09 05:11:30 UTC
From: rnelson@watserv1.waterloo.edu
Message-ID: <1990Jun9.051130.24168@watserv1.waterloo.edu>
Source record: 11039

A new field day logging program is now available via anonymous ftp
at ucsd.edu (128.54.16.1) in /pub/hamradio. FIELDAY.ZIP was tested by
our club (VE3IC) last year. The author, Paul Cassel (VE3SY) has done
an excellent job. Please try out this program and let me know what
you think of it. I will pass on your comments to Paul.

3429. Request for mods for Pro-2024

Newsgroup: rec.ham-radio
Date: 1990-06-09 08:01:58 UTC
From: whorfin@pixar.uucp
Message-ID: <11381@pixar.UUCP>
Source record: 11034

My request for mods for the Pro-38 met with thunderous silence. I have heard from two sources that ``you can't do that''.

In the mean time, how about the Pro-2024? The usual - restoral of 66-88, 800, more memory. I note that this model is extremely similar to the Pro-2022 which has far more memory, and 800 coverage.

Rick Sayre "Use more honey;
ucbvax!pixar!whorfin find out what she knows"

3432. need filter advice

Newsgroup: rec.ham-radio
Date: 1990-06-09 19:56:37 UTC
From: hs0u+@andrew.cmu.edu
Message-ID: <kaQJFpW00WB8JEBkNh@andrew.cmu.edu>
Source record: 11037

I'm considering IRCI and Fox Tango filters for my TS-430S. Does anyone out there in netland have an opinion as to which I should get? I plan on getting a 400Hz CW filter and a 1.8kHz narrow SSB filter. Thanks and 73.

-Harry hs0u@andrew.cmu.edu NR3L-

3433. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-06-09 23:14:30 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9006092317.AA05222@ucsd.edu>
Source record: 11038

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Good choice of terms. They're correct.

> The secondary stations, in the event of an emergency, tuned to one of the
> primary stations and rebroadcast it. The EBS equipment rack included
> tone detection, etc. and a specially packaged AM radio (not mil-spec, though,
> supposedly of lower quality than the cheapest auto AM radios).

In the OLD days, we used 'semi-cheap' rack mount radios that operated on carrier the carrier detect idea. You tuned it to the Primary EBS station for your region and pressed a button to lock a relay to silence the receiver. As long as the primary maintained a carrier, the receiver stayed quiet. When the primary ran a test, they started by turning the plates off and on on the transmitter 3 times to trigger all the monitors at the secondary sites, then ran a cart with the old familiar tone followed by the "....If this had been an actual alert, you would have been instructed...". When a primary ran a test, the secondaries only logged it but ran their own according to a set schedule. If a REAL notification came through, secondaries were supposed to tell people where to tune (just like the old Conelrad 640/1240 stuff) then sign-off, NOT rebroadcast material. I guess the idea was to cut the clutter and make sure ONLY authorized info was disseminated.

> I think this is why there is divergent opionion in this discussion from
> knowledgeable radio station people - the EBS implementation varied, depending
> on what kind of station it was installed in.

Basically it's the same now except the old carrier latch receivers have been replaced with the dual tone decoders and there are now several more levels of alert as opposed to the old "The sky is falling! Run for your lives!" approach :-)

As to the tapes everyone is talking about, some stations still keep the scripts in a copy book for the console operator to read and others have them already canned so all the jock has to do is stuff in the cart, hit a button and run for the shelter (:-) again)

STS-35/SAREX MISSION DELAYED

HR AMSAT NEWS SERVICE BULLETIN 160.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 9, 1990
TO ALL RADIO AMATEURS BT

STS-35/SAREX Mission Delayed Possibly for Two Months

This week NASA engineers and technicians found the hydrogen leak which prevented the lift-off of the shuttle Columbia (STS-35) on May 29th. Because of the danger of an explosion from a hydrogen leak in the engine compartment, NASA officials scrubbed the launch and worked up a plan to find it. The leak was located between two plates that connect the shuttle and the external tank. Since this is considered a major repair and one that cannot be performed on the launch pad, Columbia will have to be rolled back to the huge Vehicle Assembly Building (VAB). The roll-back will happen sometime next week and the repair of the leak and the return to flight readiness status of Columbia could take about a month. Complicating the repair work is the planned launch of the shuttle Atlantis (STS-38) for mid-July. Since Atlantis is carrying a secret military payload, it has national security priority over the scientific mission of STS-35. NASA officials now are saying that it could be August before Columbia and the STS-35/SAREX mission can get off the ground.

STS-35 is planned to be an all scientific shuttle mission carrying the ASTRO-1 observatory in its cargo bay. Also flying aboard as a secondary experiment is the Shuttle Amateur Radio Experiment (SAREX) payload. The SAREX station consists of a packet radio ROBOT TNC, a 2 meter FM hand-held transceiver, and a Grid laptop computer to be operated by Payload Specialist, Ron Parise (WA4SIR). The special software written for this packet station will allow amateurs to receive a QSO number after they successfully connect with the station on packet. Also, the plan is for WA4SIR to conduct 2 meter FM voice QSOs with amateurs on the ground.

Please stay tuned to AMSAT Nets and for further updates on the STS-35/SAREX mission.

ZRO TESTS CONTINUE

HR AMSAT NEWS SERVICE BULLETIN 160.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 9, 1990
TO ALL RADIO AMATEURS BT

Station Receiving Tests Continue

The following Mode "B" and "JL" ZRO tests remain in the current test rotation. They are scheduled for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" tests on 435.945 MHz.

Saturday June 16, 1990 at 2200 UTC "JL"
Saturday June 16, 1990 at 2340 UTC "B"
Saturday June 30, 1990 at 1840 UTC "JL"
Saturday June 30, 1990 at 1930 UTC "B"

Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

SB ALL @ AMSAT $ANS-160.03
NOMINATIONS FOR AMSAT-NA BOD

HR AMSAT NEWS SERVICE BULLETIN 160.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 9, 1990
TO ALL RADIO AMATEURS BT

Nominations Period for Three Seats on AMSAT-NA BOD to Close Soon

Nominations are sought for the AMSAT Board of Directors. Directors are elected by the membership for a two-year term. Any member society or group of five members may nominate someone (a member) to run for the position.

This year there are three seats to be filled. Those directors whose seats are up for election are Phil Karn, KA9Q, Tom Clark, W3IWI, and the seat vacated by the resignation of Vern Riportella, WA2LQQ.

All nominations should be sent to AMSAT BoD Nominations, 850 Sligo Ave #600, Silver Spring, MD 20910 to arrive no later than June 15, 1990.

SB ALL @ AMSAT $ANS-160.05
AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 160.05 FROM AMSAT HQ
SILVER SPRING, MD JUNE 9, 1990
TO ALL RADIO AMATEURS BT

Transponder Schedule for AO-13 Effective 05MAY90

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 100
Mode-JL : MA 100 to MA 125
Mode-LS : MA 125 to MA 130 (Mode S Beacon only)
Mode-S : MA 130 to MA 135
Mode-BS : MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

The current attitude is:

BLON = 179.2 and BLAT = -2.8 for 11 Jun 90

Cross mode B and S QSOs are possible during MA 135 to 140.

AO-10's Mode-B Transponder Now Available for Use:

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination
to support Mode-B transponder operations, therefore, the transponder is
available for general use whenever AO-10 is in view at your location.
Please DO NOT use the transponder if the signals are FMing. The current
estimate of AO-10's attitude is LON 24 deg LAT -9 deg.

[AO-10 update received from Graham Ratcliff, VK5AGR, via AO-13 beacons.]

{re: carts machines @ some stations}

It may be hard to believe, but there are stations with no cart
machines. WFMT in Chicago comes to mind. NO recorded commercials
allowed--the announcer read it, or you didn't hear it. Just
imagine, no blabber music at all. No SAVE SAVE SAVE at Ed's
Edsel of Edgewood.

Sure wish the rest of the world got WFMT.

>If nothing like this exists on the market I will design and build one,
>but I'd prefer to buy.

I can't help you myself but you might try to contact Rich Muller's group
at LBL in Berkely. About 5 years ago they were working on a mini cyclotron
to use for very precise mass spectrometry/Radioisotope dating. They needed
a stable, wide-band frequency source and found that one of the Kenwood
transmitters would do the job better and at a fraction of the price
of a lab-grade signal generator. Couple of his grad students ended up
getting their tickets as a result!

Cross-posted to: rec.ham-radio.packet,rec.ham-radio

I, and several others, are searching for TCP/IP sources which have been
ported to SCO Xenix.

Sources, assistance and/or leads most appreciated.

Thanks!

Noel

3442. Unix/Xenix Logging Program Wanted

Newsgroup: rec.ham-radio
Date: 1990-06-10 16:46:04 UTC
From: noel@ubbs-nh.MV.COM
Message-ID: <4391@ubbs-nh.MV.COM>
Source record: 11059

Not being a programmer is sometimes a real drag...

I'd like to find the sources for a logging program written for Unix or Xenix, or a DOS version written in C which has possibilites of being ported.

I'd even be willing to purchase such an animal if it were available.

Any help, sources, binaries, leads or other info greatly appreciated.

Thanks!

Noel

In "canremote!greg.trice", Greg Trice writes a need for a receiver with, among other things, a

>Sensitivity of 0.5 uV
>Ability to withstand 1000V pulses on input without blocking or damage.

This sounds a lot like a receiver with a Blocking Dynamic Range of over 180dB. If such a receiver is found, Greg, let us know...and let us know the price.

>73 de Randy VE3WRN

I grabbed this program from ucsd.edu and it appears to be excellent!
(Thanks Randy!)

This brings up an interesting question which is apt at this time of year. Does anyone know of other good field-day logging programs written for older machines such as the Apple II+ (or in my case) for some of the CP/M machines? I really hate to consider taking my mega-buck 386 to field day for logging purposes.. but the old Model-4 would be absolutely perfect! Call me old and nervous... but a generator running my computer makes me a little queasy! :-)

Anything buried in the recesses of SIMTEL or any other FTP sites?

> need a big supply of either. I've been having very good returns on Soviet

This posting is good advice. I usually use greenstamps, but even where they're OK (which is most places) you always run the risk of the local P.O. workers filching the money. Thus foreign airmail stamps do help sometimes. I get mine from William Plum, 12 Glenn Road, Flemington, NJ 08822. An SASE will bring a price list. Generally the stamps will run you $1-$1.50 so it's reasonably priced against a greenstamp. And I agree with the above - the return is on average quicker.

P.S. - My PO charges 95c for IRCs also. You gotta watch the USPS employees, though - a lot of them don't know what they are, and even more don't know which side *they* stamp it on (if it's stamped on the wrong side it's invalid)!

3446. USA ham call words -corrected

Newsgroup: rec.ham-radio
Date: 1990-06-10 21:31:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500570@ux1.cso.uiuc.edu>
Source record: 11051

The previous posting of usa ham call words was incorrect. The following is the corrected list. Note that capitalized words are proper names. Fully upper case words are acronyms. Quite many of these have never been assigned by the FCC, so this may further encourage you to get the FCC to allow us to request vanity callsigns. DO NOT use any of these words for passwords, as they were derived from /usr/dict/words which also means some proper names are not capitalized.
